

S2 Fig. Age distribution of the subjects analysed in the fundus sub-study compared to the full KORA-S4 survey.

Shown are the age distributions of the subjects in the full KORA-S4 survey (n=4,262), for the subjects analysed in this fundus sub-study (available and gradable fundus images for each eye, no competing retinal disease, n=2,546), and for the subjects not analysed (n=1,715). The age distribution for the analysed subjects is shifted towards the younger when compared to the full KORA-S4 survey.
