1 Supplementary Experimental Procedures

1.1 Generation of mKate2-Stat3 Knock-in Mice

1.1.1 ESC Gene Targeting

40 μg gene targeting constructs were linearized with NotI in a total reaction volume of 200 μl . The successful linearization of gene targeting constructs was validated by gel electrophoresis with 0.5% agarose gel at 30 V for 10 h at 4 $^{\circ}\text{C}$. Successfully linearized gene targeting constructs were stored at -20°C . ESC line JM8A3 was cultivated on neomycin resistant mouse embryonic fibroblasts that served as feeder cells. Linearized gene targeting constructs were thawed and precipitated with NaAc and ethanol one day before use for electroporation into ESC. Precipitated DNA was washed with 70% ethanol three times and stored in last wash solution overnight at 4 $^{\circ}\text{C}$. The next day ESC were washed with PBS two times and trypsinized with 1 ml trypsin (6-cm dish) for 2 min 37 $^{\circ}\text{C}$. To obtain a single cell suspension, ESC were pipetted up and down gently and spun down at 1000 $\times\text{g}$ for 5 min.

At the day of electroporation, ESC cultivated in 10-cm dishes were washed for two times with PBS and then trypsinized with 2.5 ml trypsin for 5 min. 10 ml ESC medium was used to terminate trypsinization and obtain a single cell suspension by centrifugation at 1000 $\times\text{g}$ for 5 min. The ESC pellet was resuspended with 0.5 to 1 ml PBS. The linearized DNA pellet was resuspended with 250 μl of PBS and mixed with 500 μl ESC in PBS in an electroporation cuvette. Electroporation was performed with a gene pulser cuvette 0.4 cm electrode gap, 50 Biorad Electroporator 240 V, 500 μF , Time constant 5 to 7 s. The ESC were kept at room temperature for 20 min and diluted with ESC medium. Diluted cells were plated on 8 \times 10-cm dishes with feeder cells. Selection with G418 and Ganciclovir was initiated 24 h after electroporation: 4 plates with 300 $\mu\text{g}/\mu\text{l}$ G418 only and 4 plates with 300 $\mu\text{g}/\mu\text{l}$ G418 and 255 $\mu\text{g}/\mu\text{l}$ Ganciclovir. Media were refreshed every second day.

12 \times 48-well plates with neomycin resistant feeder cells (500 $\mu\text{l}/\text{well}$) were prepared for later use. A total number of 288 clones were isolated with a 200 μl tip and transferred to one well of 48-well plate. All clones were kept in selective medium with G418. Around 12 days later, the clones were washed once with 500 μl PBS and trypsinized with 100 μl trypsin for 1.5 min at 37 $^{\circ}\text{C}$. The clones were dissociated by pipetting up and down gently for 12 times with 200 μl tip. 800 μl ESC medium were used to terminate trypsinization and cells were transferred to a new 48-well plate with MEFs as feeders. Media were refreshed every day (500 $\mu\text{l}/\text{well}$).

24-well plates with gelatin coating were prepared for all clones with 1 ml ESC medium. 48-well plates of ESC clones were processed when they were confluent. 1/3 of the ESC were transferred to one well of 24-well plate with gelatin coating and 2/3 of the ESC were frozen down. Each clone was trypsinized with 100 μl trypsin and resuspended with 200 μl Solution A (70% ESC medium and 30%). 100 μl of the total 300 μl cell suspension were transferred to one well of 24-well plate for DNA isolation. All 24-well plates were incubated at 37 $^{\circ}\text{C}$ with 5% CO_2 . 48-well plates with 2/3 of ESC were incubated on ice for several minutes and frozen down by adding 200 μl of Solution B (50% ESC medium, 30% FCS and 20% DMSO). All 48-well plates with 2/3 of each clone were sealed with tape and wrapped in plastic. ESC clones were frozen at -80°C .

ESC in 24-well plate were washed once with PBS and lysed with 500 μl lysis buffer. Cells were incubated with lysis buffer in the incubator overnight. 500 μl lysate was transferred with a 1 ml tip to 1.5 ml Eppendorf tube and mixed with 250 μl NaCl solution (5 mol/l) by shaking vigorously for around 1 min. Cellular debris was removed by centrifugation at 20000 $\times\text{g}$. 550 μl supernatant was mixed with 450 μl isopropanol to precipitate DNA. Precipitated DNA was washed with 500 μl 70% ethanol. The pellet was dried on the bench for 2 to 3 min and dissolved in 200 μl TE.

1.1.2 Blastocyst Injection and Embryo Transfer

For each positive ESC clone, around 45 blastocysts were used for injection. For each blastocyst, around 10 to 15 ESC were injected. Those 45 injected blastocysts were transferred to three foster mothers.

1.2 Genotyping PCR

Genotyping PCR for mKate2-Stat3 was performed with a 3-primer strategy (B7, F5 and D2), using one forward primer located on the wild type genomic DNA, one reverse primer located on the wild type genomic DNA and an additional forward primer located within the mKate2 coding sequence. Genotyping PCR for removal of selection cassette was performed with 2-primer PCR (G2 and B8). Example PCR results can be seen in Figure S11.

Table S1: Genotyping primers

| Name | Sequence |
|------------|-------------------------------|
| B7-forward | TCTGTTCTCCCAATCCTTCC |
| F5-forward | GCGGGTTTCTTGGATCTGTA |
| D2-reverse | taccgGAATTCGTTTGATCCCCAGCATCA |
| G2-forward | CTCTCTCCCATGTGAAGCCC |
| B8-reverse | GGCTAGCCTGAGACCCTGTT |

1.3 Southern Blotting

Southern blotting was performed with a non-radioactive method using probes directly labeled with Alk-phosphatase. Genomic DNA was extracted using standard procedure and digested with restriction enzymes overnight. DNA was digested with EcoR V and Kpn I and separated by electrophoresis with 0.6 % agarose gel and transferred to a positively charged nitrocellulose membrane. Specific probes were labeled with Alk-phosphatase (RPN3680, GE Healthcare) and used for hybridization. CDP-STAR (RPN3682, GE Healthcare) was used for development and ImageQuant LAS 4000 (GE Healthcare) used to acquire luminescent signal after development.

1.4 AAV Vector Production

AAV vectors were produced using a standard triple transfection protocol as described previously [1]. Briefly, an AAV helper plasmid encoding AAV rep and cap genes, an AAV vector plasmid carrying the transgene as well as an adenoviral helper plasmid were transfected into HEK293T cells. The cap gene in the AAV helper was derived from wild type AAV serotype 9 through insertion of a short DNA oligonucleotide encoding a heptamer peptide. Human Histone2B was kindly provided by Jörg Langowski and mCerulean was kindly provided by David W. Piston. The hH2B-mCerulean cassette was amplified by PCR, digested with Age I and Avr II restriction enzymes and ligated into the AAV vector plasmid. The AAV vector plasmid expressing a fusion of H2B and mCerulean under the control of a cytomegalovirus (CMV) promoter was based on pSSV9, a plasmid that is routinely used for generation of single-stranded AAV vectors. For the triple transfection, ten 15 cm²-dishes with 4×10⁶ HEK293T cells per dish were seeded two days prior to transfection. Using polyethylenimine (PEI) as transfection reagent, the cells were then triple-transfected with 14.6 µg of each plasmid per dish. 43.8 µg total DNA were diluted in DMEM without any supplements, mixed with 140 µl of PEI (1 mg/ml in H₂O), and incubated for at least 30 min at room temperature. This mixture was next added dropwise to the cells and incubated at 37 °C for three days, before the cells were harvested into the medium and pelleted at 1200 rpm for 15 min. After one wash step with PBS, the pellet was resuspended in 6 ml lysis buffer (50 mmol/l Tris-HCl pH 8.5, 50 mmol/l NaHCO₃) and subjected to five rounds of freezing and thawing (−80/37 °C). Following digestion of the cell lysate with 50 U/l benzonase for 1 h at 37 °C, cell debris was removed by centrifugation at 3750 rpm for 20 min. For purification, the virus-containing lysate was added to a preformed gradient of 15 %, 25 %, 40 % and 60 % iodixanol (OptiPrep in PBS-MK; PBS with 1 mmol/l MgCl₂, 2.5 mmol/l KCl) and centrifuged in a 70.1 Ti rotor (Beckman Coulter) at 50 000 rpm and 4 °C for 2 h. Using needle and syringe, purified viral particles were retrieved from the 40 % phase and stored in 50 µl aliquots at −80 °C. A vector titer of 9.17×10¹⁰ genome copies per ml was determined using standard RT-PCR.

1.5 Live Cell Imaging of mKate2-STAT3

Primary hepatocytes were seeded at 15000 cells/well into 96-well plate pre-coated with collagen I in adhesion medium. 4 hours after seeding, media were changed to pre-starvation medium and hepatocytes were pre-starved overnight (15 to 16 hours). On the next day, hepatocytes were starved for 5 hours before pre-treatment with DMSO or Ruxolitinib. Serially diluted doses of IL-6 were applied after 1 hour of pre-treatment with DMSO or Ruxolitinib. STAT3 dynamics were monitored before inhibitor pre-treatment, after inhibitor pre-treatment and after IL-6 stimulation.

Hepatocytes were imaged with Nikon Eclipse Ti Fluorescence microscope controlled with NIS-Elements software. Temperature (37 °C), CO₂ (5 %) and humidity were held constant through an incubation chamber enclosing the microscope and a 96-well plate stage insert. Three channels were acquired for each position: brightfield channel, STAT3 channel (mKate2) and nuclear channel (CFP channel).

Time-lapse live cell microscopy was performed with Nikon Ti-HCS screening microscope. Nikon Ti-HCS is a Nikon ECLIPSE Ti microscope that was equipped with okolab incubation chamber and fully automated xyz stage controller. Image acquisition was done with Andor Clara camera (model DR-328-C01-SIL, OXFORD INSTRUMENTS), which is a high-sensitive interline-CCD-camera with 1392 × 1040 pixel resolution. Each pixel has a size of 6.45 × 6.45 μm. 20× air objective (NA = 0.75) was used.

1.6 Generation of Recombinant Calibrator Proteins

Glutathione S-transferase (GST) or streptavidin binding peptide (SBP)-tagged murine proteins were used for normalization of immunoblot data and as reference for the determination of molecules per cell. gp130 (cytoplasmic domain) and STAT3 were cloned into pGEX-2T (GE Healthcare) and SOCS3 was cloned into pGEX-2T derived vector pSBPEX. The resulting GST-gp130, GST-STAT3 and SBP-SOCS3 were expressed in *Escherichia coli* BL21(DE3) CodonPlusRIL (Stratagene) and extracted by lysozyme lysis and sonication. Glutathione sepharose beads or streptavidin sepharose beads were added to lysates and bound recombinant proteins were eluted by addition of reduced glutathione or biotin for GST- or SBP-tagged proteins, respectively. For quantification of purified proteins, dilution series of purified bovine serum albumin and recombinant proteins were separated by 10 % SDS-polyacrylamide gel electrophoresis and stained with Coomassie Brilliant Blue. The gel was documented using the trans-illumination mode of LumiImager F1 and band quantification was achieved with LumiAnalyst software (both Roche).

1.7 Preparation of total cell lysate from primary human hepatocytes

After appropriate treatment times 2×10^6 primary human hepatocytes were lysed in 300 μl RIPA lysis buffer (50 mM Tris pH 7.2, 250 mM NaCl, 2 % (v/v) NP40, 2.5 mM EDTA, 0.1 % (w/v) SDS, 0.5 % (w/v) sodium deoxycholate (Serva), 0.1 mg/ml AEBSF, 1 mg/ml aprotinin, 1 % (v/v) 1 M Na₃VO₄, 2 % (v/v) 0.5 M NaF) and sonicated on ice (30 s, 75 % amplitude, 0.1 s on, 0.5 s off). Subsequently, samples were centrifuged 10 min at 14 000 rpm at 4 °C and supernatants were transferred into a fresh tube.

1.8 Quantitative real-time PCR

Reverse transcribed cDNA was analyzed using the Universal Probe Library System on a LightCycler 480 with the cycling conditions as shown in Table S2. Primer design was performed using the Universal Probe Library Assay Design Center. Primers and corresponding Universal Probe Library (UPL) probes are listed in Table S3.

Table S2: Cycling conditions for quantitative real-time PCR

| | | | |
|--------------|------------------|-----------------|------------------|
| Program Name | Pre-Incubation | | |
| Cycles | 1 | Analysis Mode | None |
| Target (°C) | Acquisition Mode | Hold (hh:mm:ss) | Ramp Rate (°C/s) |
| 95 | None | 00:05:00 | 4.40 |
| Program Name | Amplification | | |
| Cycles | 50 | Analysis Mode | Quantification |
| Target (°C) | Acquisition Mode | Hold (hh:mm:ss) | Ramp Rate (°C/s) |
| 95 | None | 00:00:10 | 4.40 |
| 60 | None | 00:00:30 | 2.20 |
| 72 | Single | 00:00:01 | 4.40 |
| Program Name | Cooling | | |
| Cycles | 1 | Analysis Mode | None |
| Target (°C) | Acquisition Mode | Hold (hh:mm:ss) | Ramp Rate (°C/s) |
| 40 | None | 00:02:00 | 1.50 |

Table S3: Primers and probes used for quantitative real-time PCR

| Gene | Species | UPL Probe | Forward primer (5'-3') | Reverse primer (5'-3') |
|---------------|---------|-----------|---------------------------|----------------------------|

2 Supplementary Figures

2.1 Figure S1

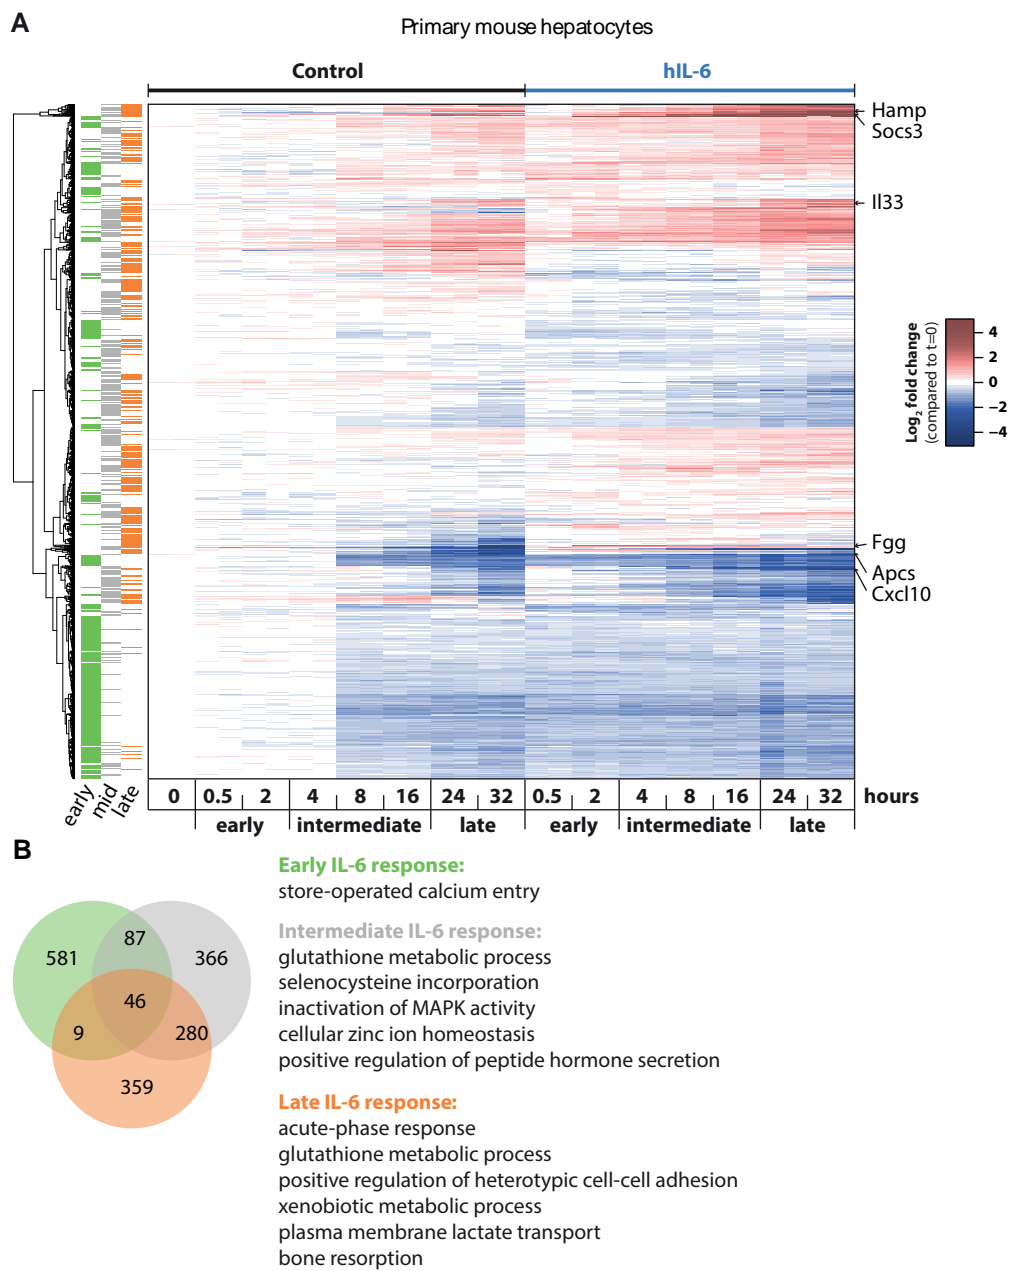

Figure S1: (A) Genome-wide analysis of IL-6-induced transcriptional responses. Hierarchical clustering of expression profiles of significantly IL-6-regulated genes. Primary mouse hepatocytes were stimulated with 40 ng/ml hIL-6 or left untreated (Control), and RNA was isolated at indicated time points. Transcriptome profiling was performed as described in Figure 2. Expression values are centered to mean expression of t=0 Control samples. (B) Venn diagram shows numbers of genes overlapping in their IL-6-temporal regulation. Results of ontology analysis are listed for each response class.

2.2 Figure S2

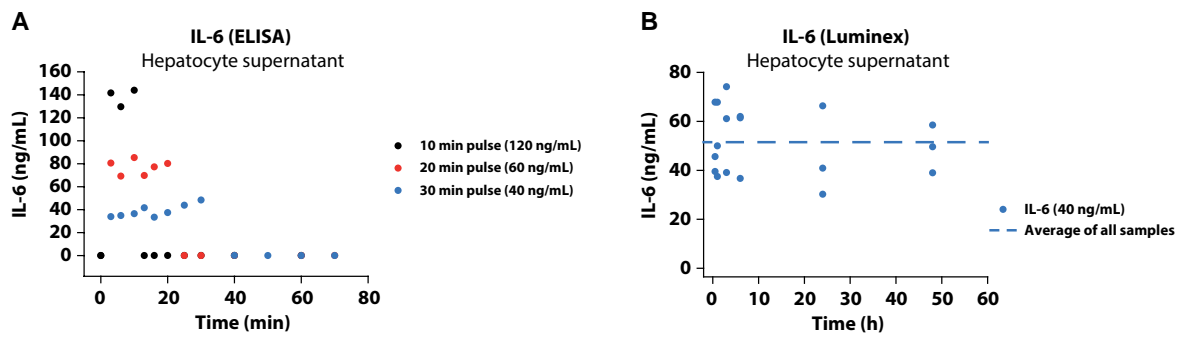

Figure S2: (A) Primary mouse hepatocytes were pulse-stimulated with indicated concentrations of hIL-6. At respective time points, IL-6 concentrations in hepatocyte medium were measured by ELISA. (B) Primary mouse hepatocytes were stimulated with 40 ng/ml of hIL-6 (continuous). At indicated time points up to 48 h, IL-6 concentrations in medium were analyzed by a bead-based immunoassay. The experiment was performed in three biological replicates, the average of all samples is indicated (dashed line).

2.3 Figure S3

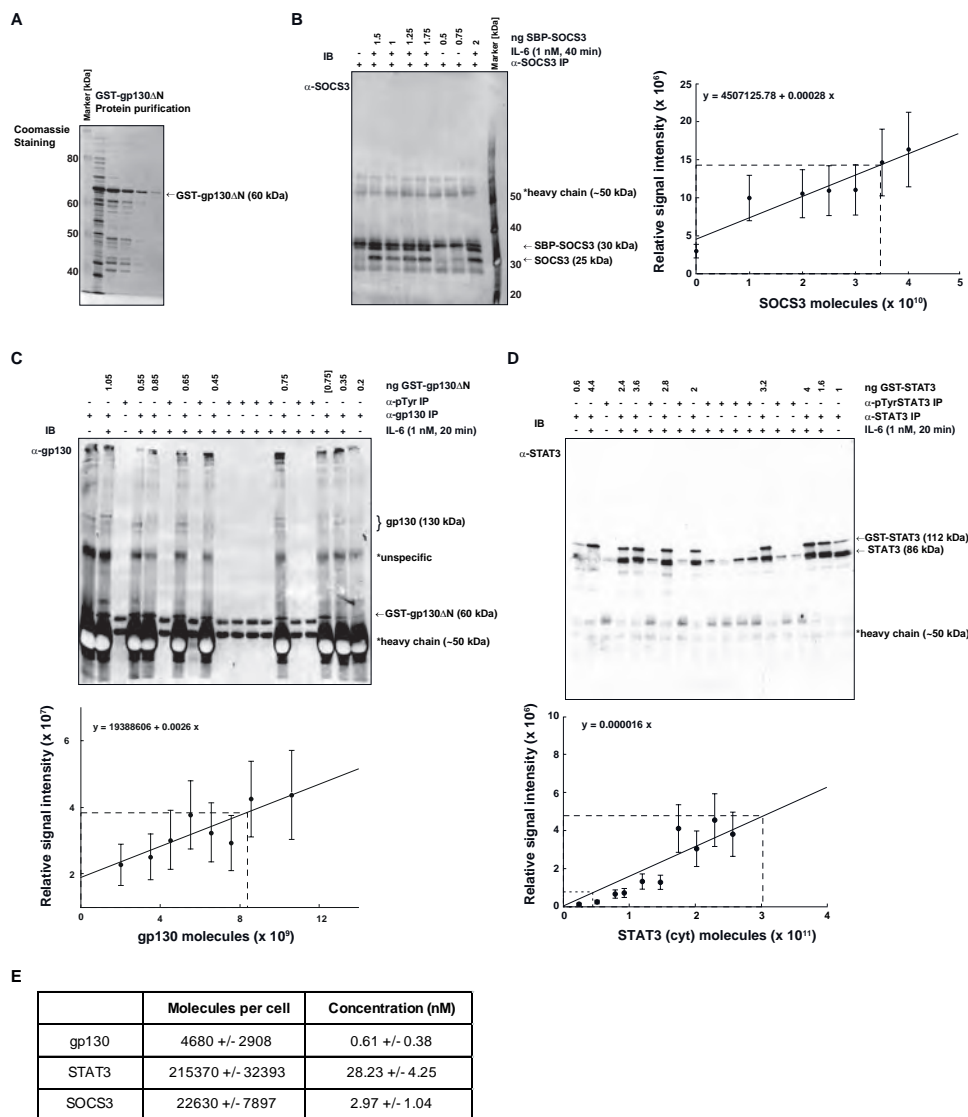

Figure S3: (A) Coomassie-stained gel of protein fractions after purification and size determination of GST-gp130 Δ N. As described in the Supplementary Materials section 1.6, gp130 was N-terminally truncated. Unpurified bacterial lysate (left) followed by sequential protein fractions from the purification process. Position of the molecular weight markers are indicated in kDa (B-D) Cytoplasmic lysates of 2×10^6 primary mouse hepatocytes were spiked with indicated amounts of recombinant GST- or SBP-tagged calibrator proteins to determine absolute protein amounts of SOCS3 (B), gp130 (C) and STAT3 (D). Protein levels were determined by immunoprecipitation (IP) and subsequent quantitative immunoblotting (IB). Fusion proteins were added at the indicated quantities to the cellular lysates. Anti-phosphoTyr immunoprecipitation was attempted to determine the position of tyrosine phosphorylated gp130 in the blot, but failed since no band was detected by the anti-gp130. Marked by an asterisks is a prominent unspecific band that appeared in all anti-gp130 immunoprecipitation reactions and was not changed by IL-6 stimulation. Signals of the recombinant calibrator proteins were fitted by a linear regression function (solid lines). The amount of calibrator protein added is indicated and samples that were not utilized for the generation of the standard curve are indicated by squared brackets. Error bars of calibrator signals represent 20% relative error. Absolute protein amounts (dashed lines) were calculated by means of the respective regression functions. Quantification results are summarized in (E).

2.4 Figure S4

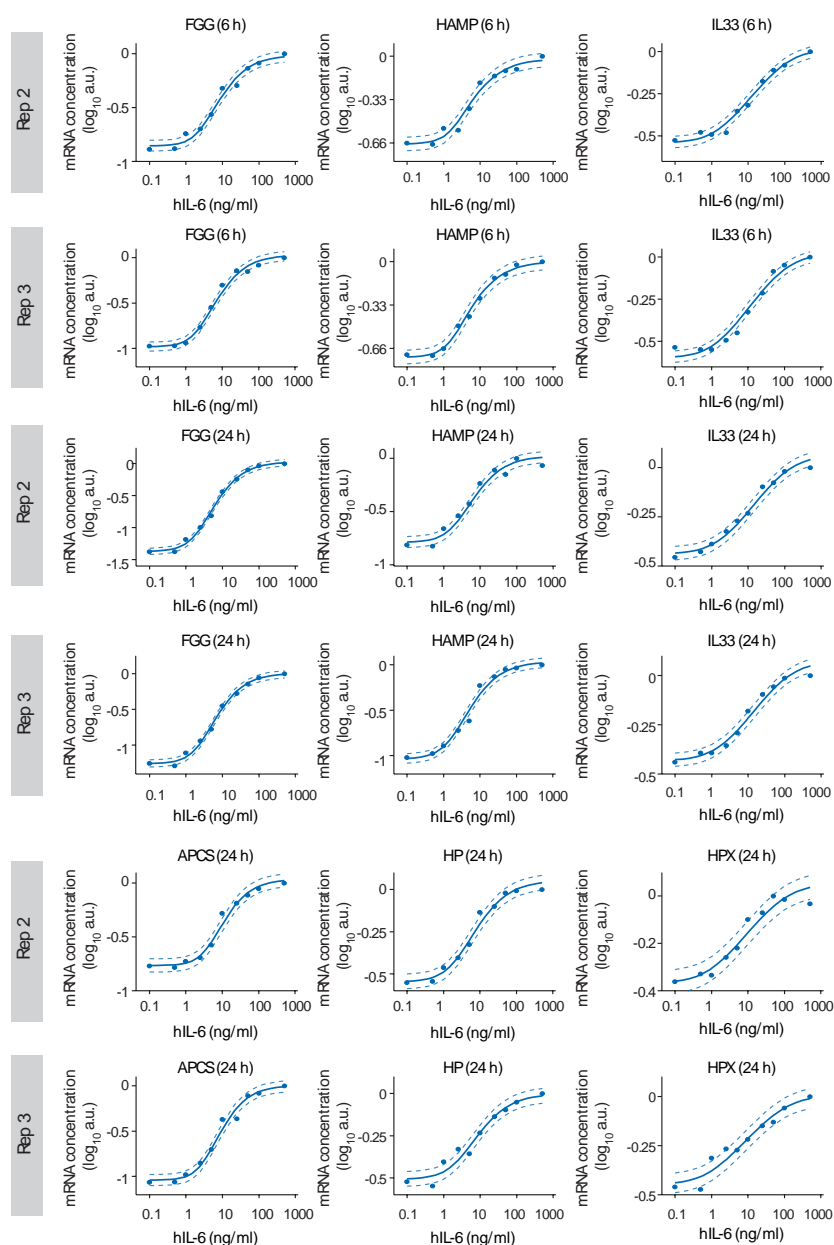

Figure S4: Additional replicates related to Figure 5. Primary mouse hepatocytes were treated with hIL-6 stimulation or were left untreated. Dose-dependent analysis of target gene expression was performed applying hIL-6 concentrations ranging from 0.1 to 500 ng/ml. At indicated time points, target mRNAs were quantified by qPCR. Filled circles: experimental data; solid lines: model trajectories. Dashed lines indicate the measurement noise as estimated by the error model. a.u.: arbitrary units.

2.5 Figure S5

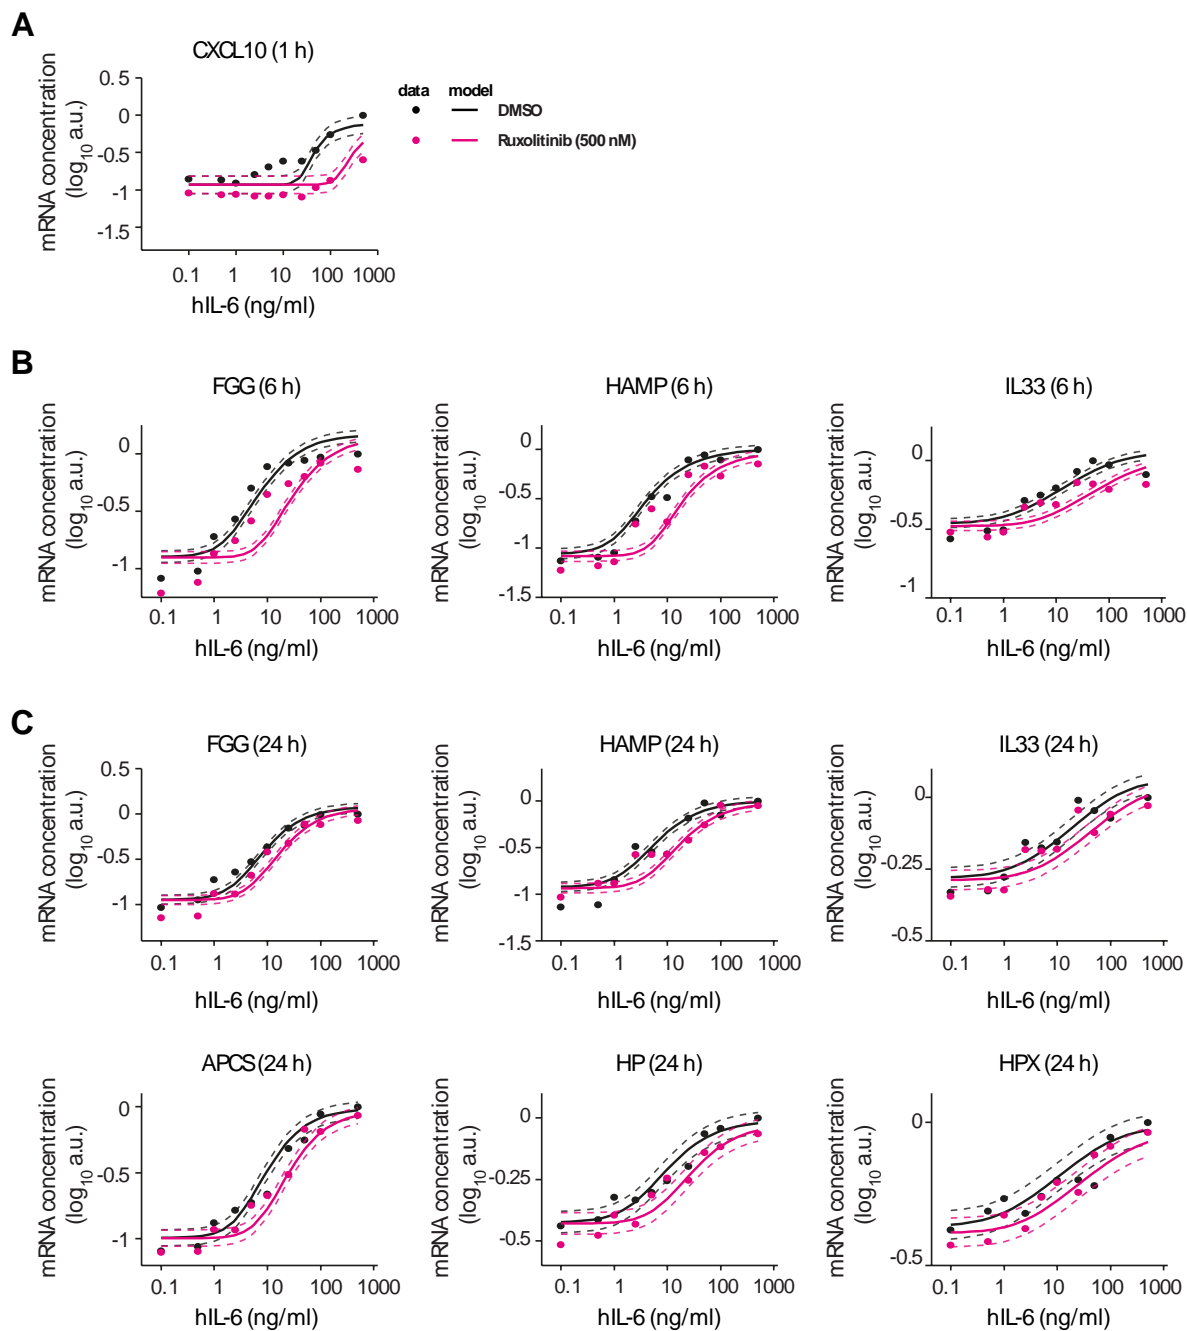

Figure S5: An individual replicate related to Figure 6. Solid lines represent model predictions for dose-dependent APP gene expression with or without Ruxolitinib pre-treatment. For experimental validation (filled circles), primary mouse hepatocytes were pre-treated with Ruxolitinib or DMSO control for 1 h prior to hIL-6 (ranging from 0.1 to 500 ng/ml) stimulation. APP mRNA expression was quantified at indicated time points by qPCR. Dashed lines indicate the measurement noise as estimated by the error model. a.u.: arbitrary units.

2.6 Figure S6

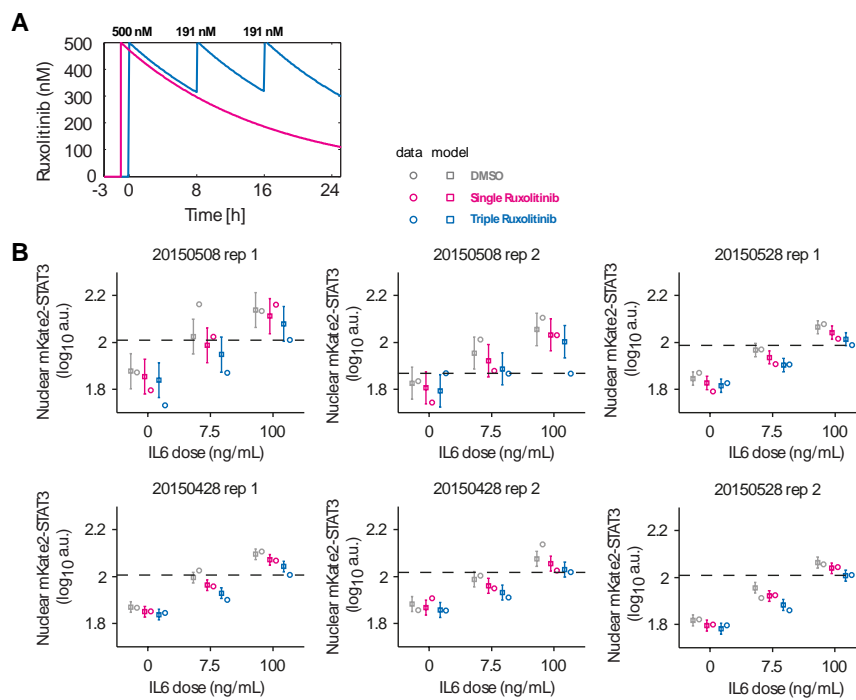

Figure S6: All replicates related to Figure 7 (n=6). Primary mouse hepatocytes were used for DMSO, single or triple Ruxolitinib dosing followed by stimulation of indicated doses of hIL-6 and time-lapse microscopy was employed to measure nuclear STAT3. Data and model predictions are shown as circles and squares, respectively.

2.7 Figure S7

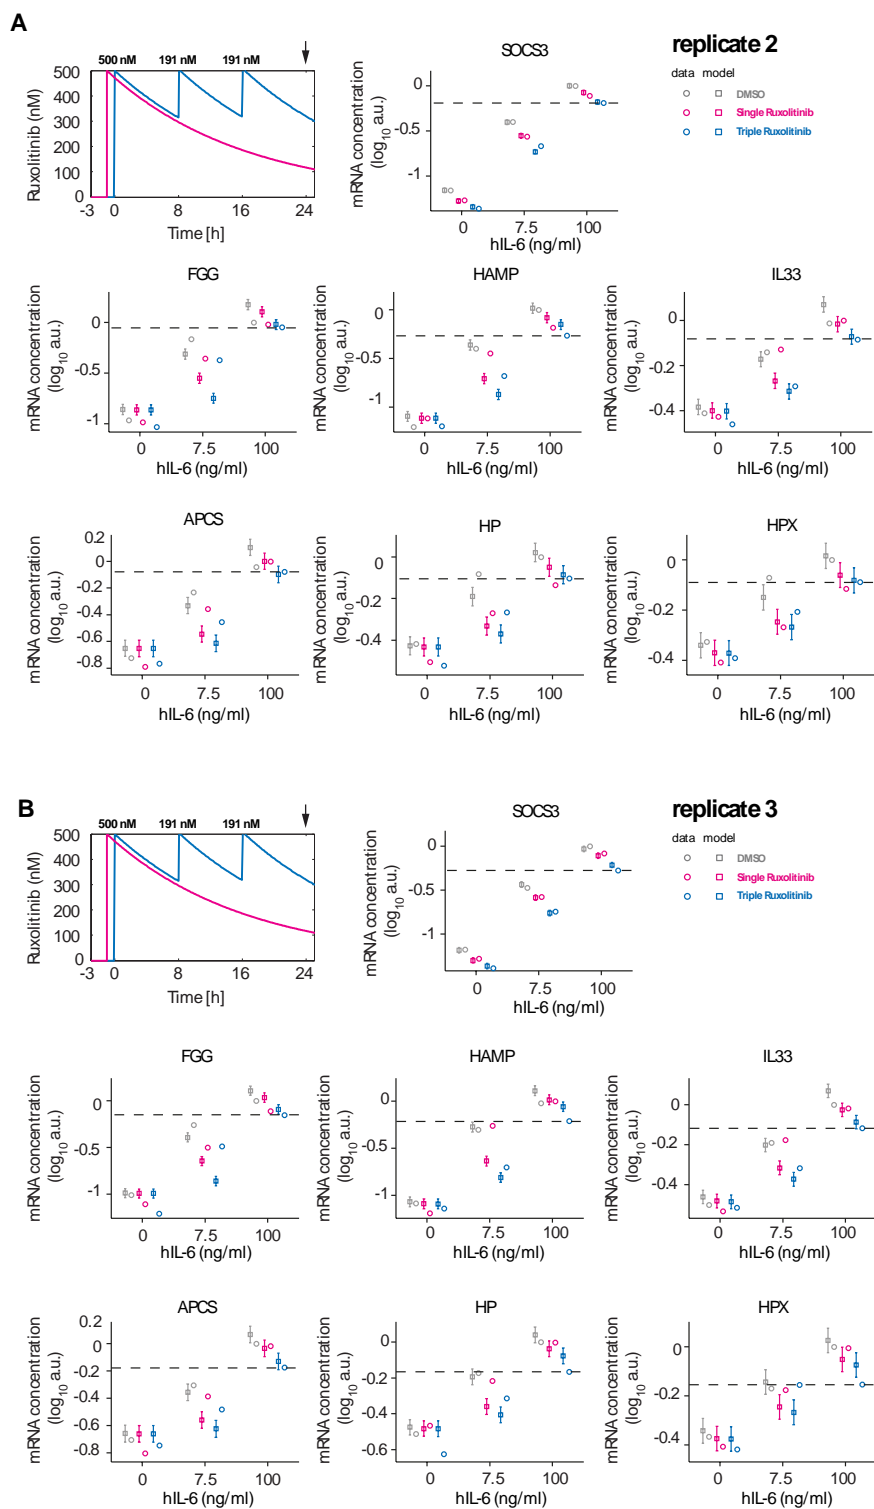

Figure S7: Two individual replicates for Figure 8. Primary mouse hepatocytes were used for DMSO, single or triple Ruxolitinib dosing and qRT-PCR was employed to measure gene expression after 24 h. Data and model predictions are shown as circles and bars, respectively.

2.8 Figure S8

Figure S8: The solid line indicates the model-predicted integral *Socs3* mRNA expression at time point 24 h depending on the time point of first Ruxolitinib (500 nmol/l) treatment. Time points of the second and third Ruxolitinib treatment (191 nmol/l each, to replenish 500 nmol/l) were fixed to achieve optimal repression (8 h and 16 h).

2.9 Figure S9

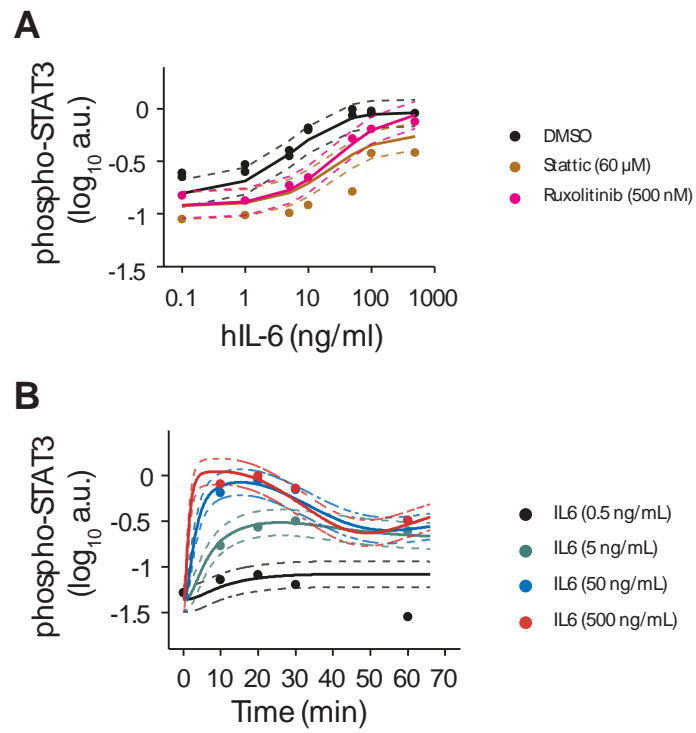

Figure S9: (A) Dose response of hIL-6 induced STAT3 phosphorylation at t= 20 min treatment with IL-6 and 1 h pre-treatment with the indicated inhibitor in primary murine hepatocytes and (B) time course of hIL-6 induced STAT3 phosphorylation in primary murine hepatocytes.

2.10 Figure S10

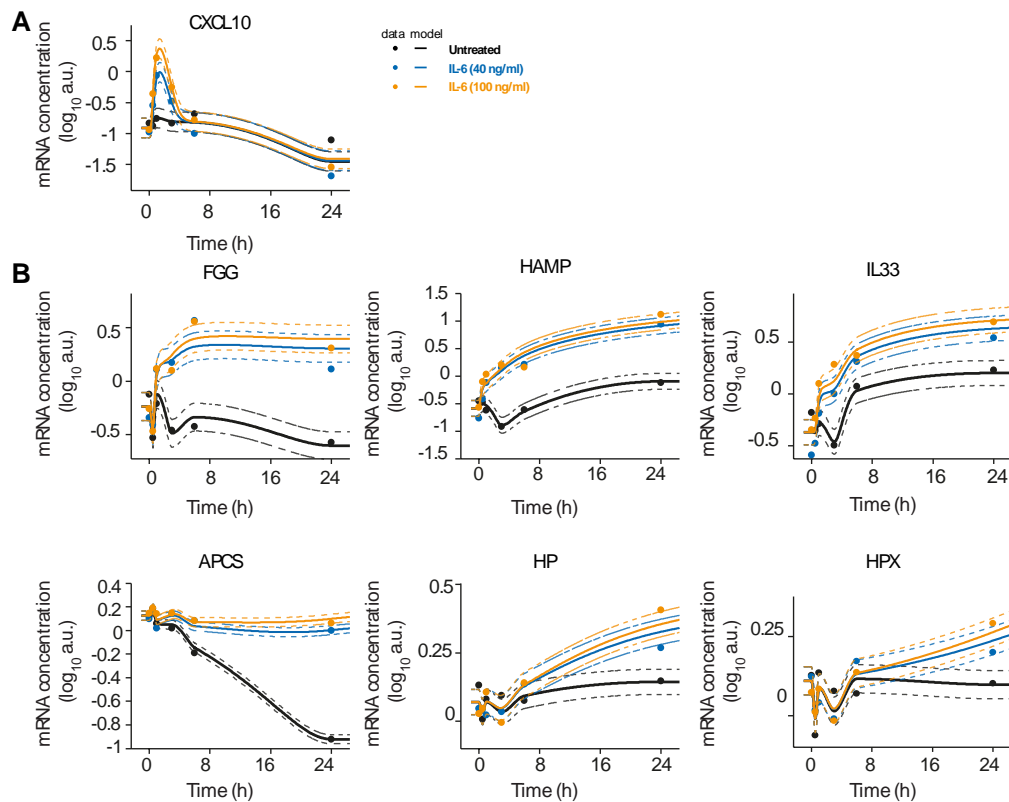

Figure S10: An individual replicate for Figure 4. Primary mouse hepatocytes were stimulated with hIL-6 or left untreated and RNA was isolated at indicated time points. Target mRNA expression was analyzed by quantitative real-time PCR (qPCR) and data were normalized to the geometric mean [2] of *Hprt* and *Tbp* expression. Filled circles represent data points; solid lines connect average values; dashed lines indicate measurement noise as estimated by the model.

2.11 Figure S11

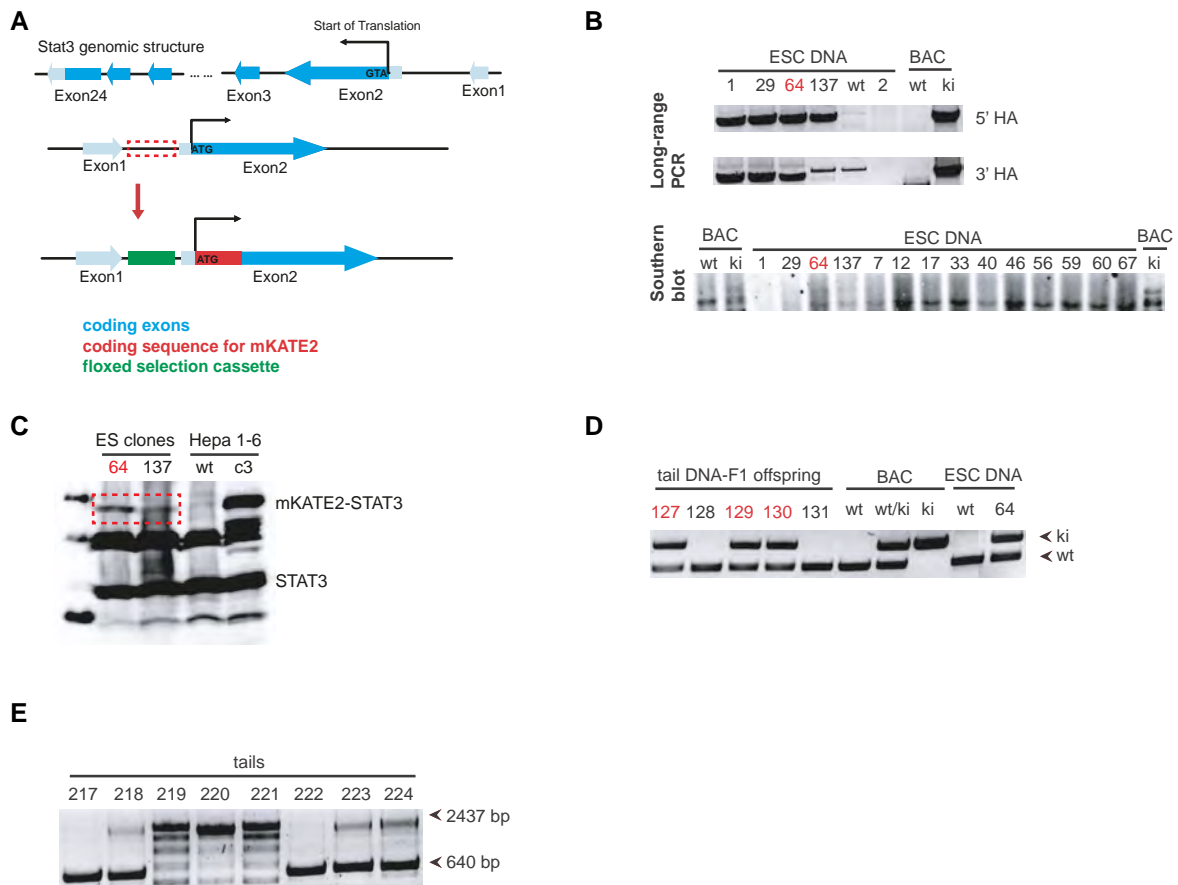

Figure S11: Generation of mKate2-Stat3 knock-in reporter mice. **(A)** Schematic depiction of the gene targeting strategy. Dark blue boxes indicate the coding exons of *Stat3*, light blue boxes indicate the untranslated exons, red box indicates the coding sequence for mKate2, and green box indicates the neomycin selection cassette (Neo) floxed by loxP sites. mKate2 coding sequence is integrated right before the first coding exon of *Stat3* to enable the expression of N-terminally tagged STAT3 fusion protein. Dashed rectangle box indicates the targeting locus. **(B)** ESC clones were screened with long-range PCR. PCR products from long-range PCR were subjected to agarose gel electrophoresis using 1% agarose gel that was stained with midori green DNA dye. The gel was documented with GelDoc using UV illumination. For Southern blot analysis for each sample 10 μ g DNA was digested using EcoRV and KpnI and separated with 0.6% agarose gel. Southern blot detection was performed with a non-radioactive technique using Alk-phosphatase labeled probes. Chemiluminescent signals were detected with ImageQuant. HA: homologous arm; ki: knock-in; wt: wild type. **(C)** Gene targeted ESC clones 64 and 137 were lysed with RIPA total cell lysis buffer and cell lysates were separated by 10% SDS-PAGE. Immunoblotting was performed with anti-STAT3 antibody. Chemiluminescent signals were detected with ImageQuant. Total cell lysates from wild type and *mKate2-Stat3* BAC transgenic Hepa1-6 clone 3 (C3) were included as negative and positive control. The red rectangle marks the knock-in allele. Clone 64 indicated by red was chosen for further experiments. **(D)** Germline transmission of gene targeted ESC clone 64 identified by PCR-based genotyping. PCR products were separated by a 1% agarose gel that was stained with midori green DNA dye. The gel was documented with GelDoc using UV illumination. DNA from bacterial artificial chromosome (BAC) and embryonic stem cells (ESC) were used as controls. Offsprings harboring the knock-in allele are indicated by red color. The image represents one litter having both agouti and black offsprings. **(E)** The Neomycin selection cassette was removed by breeding with Cre deleter mouse, and offsprings were screened with PCR-based genotyping. PCR products were separated by agarose gel electrophoresis and stained with midori green DNA dye.

2.12 Figure S12

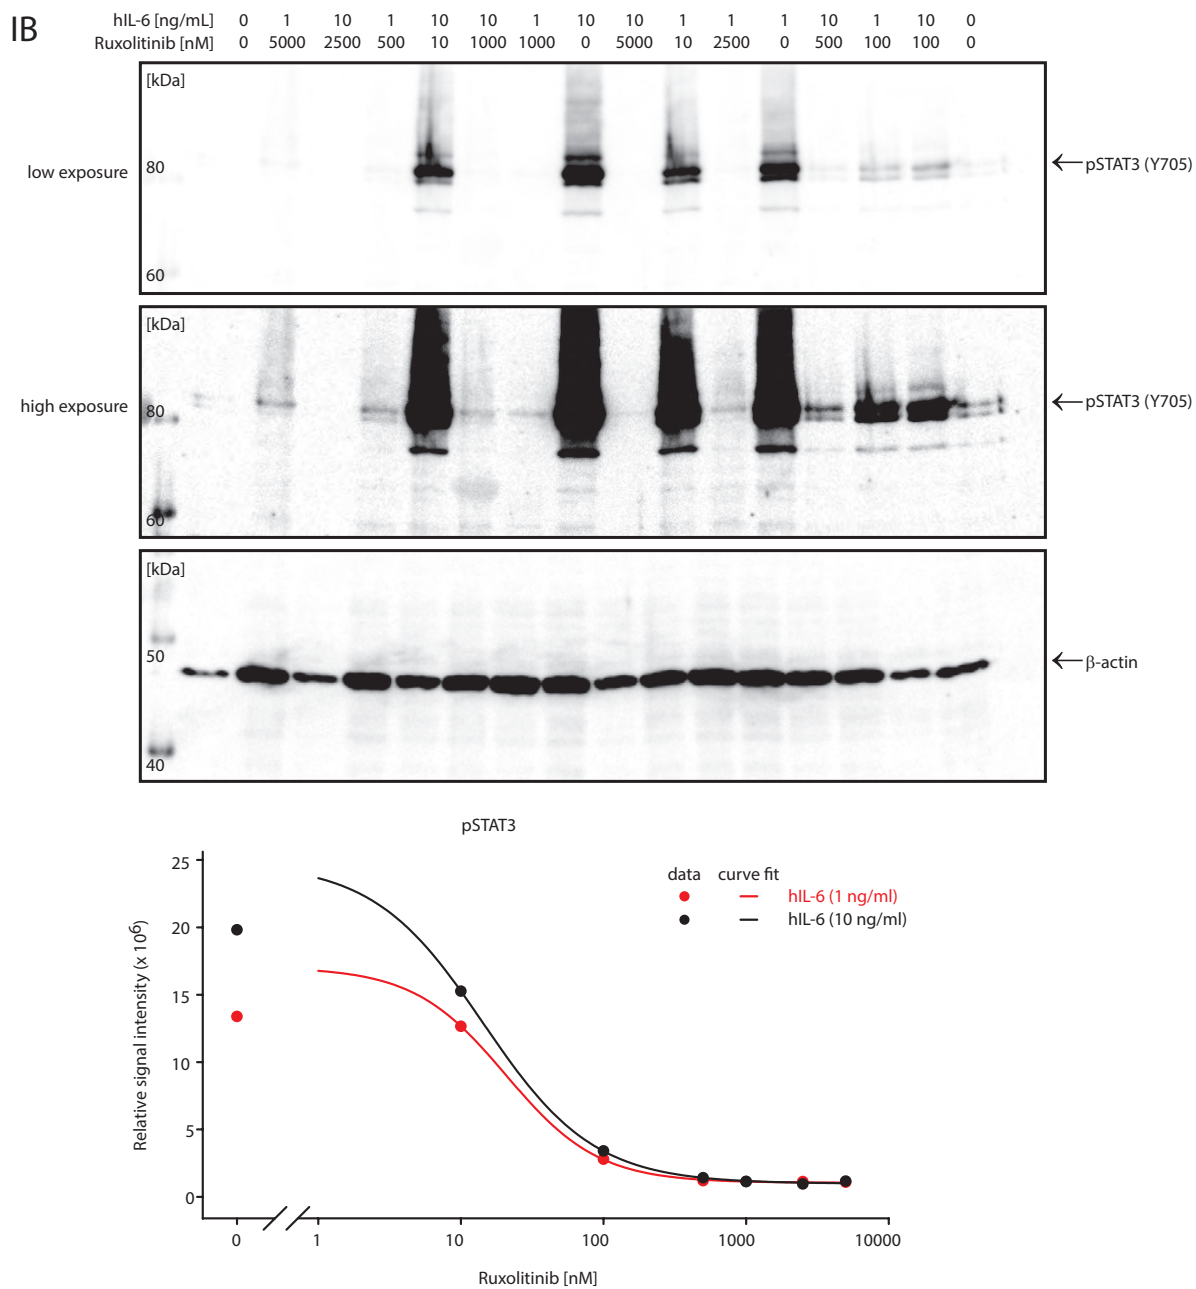

Figure S12: 2×10^6 primary human hepatocytes were co-treated with varying doses of Ruxolitinib and either 1 or 10 ng/ml hIL-6. Total cell lysates were prepared after 20 min total treatment time and subjected to quantitative immunoblotting to detect phosphorylated STAT3 (Y705) and β -actin. Four parameter logistic curve fit was conducted with SigmaPlot 13.0 (Systat Software, Inc).

2.13 Figure S13

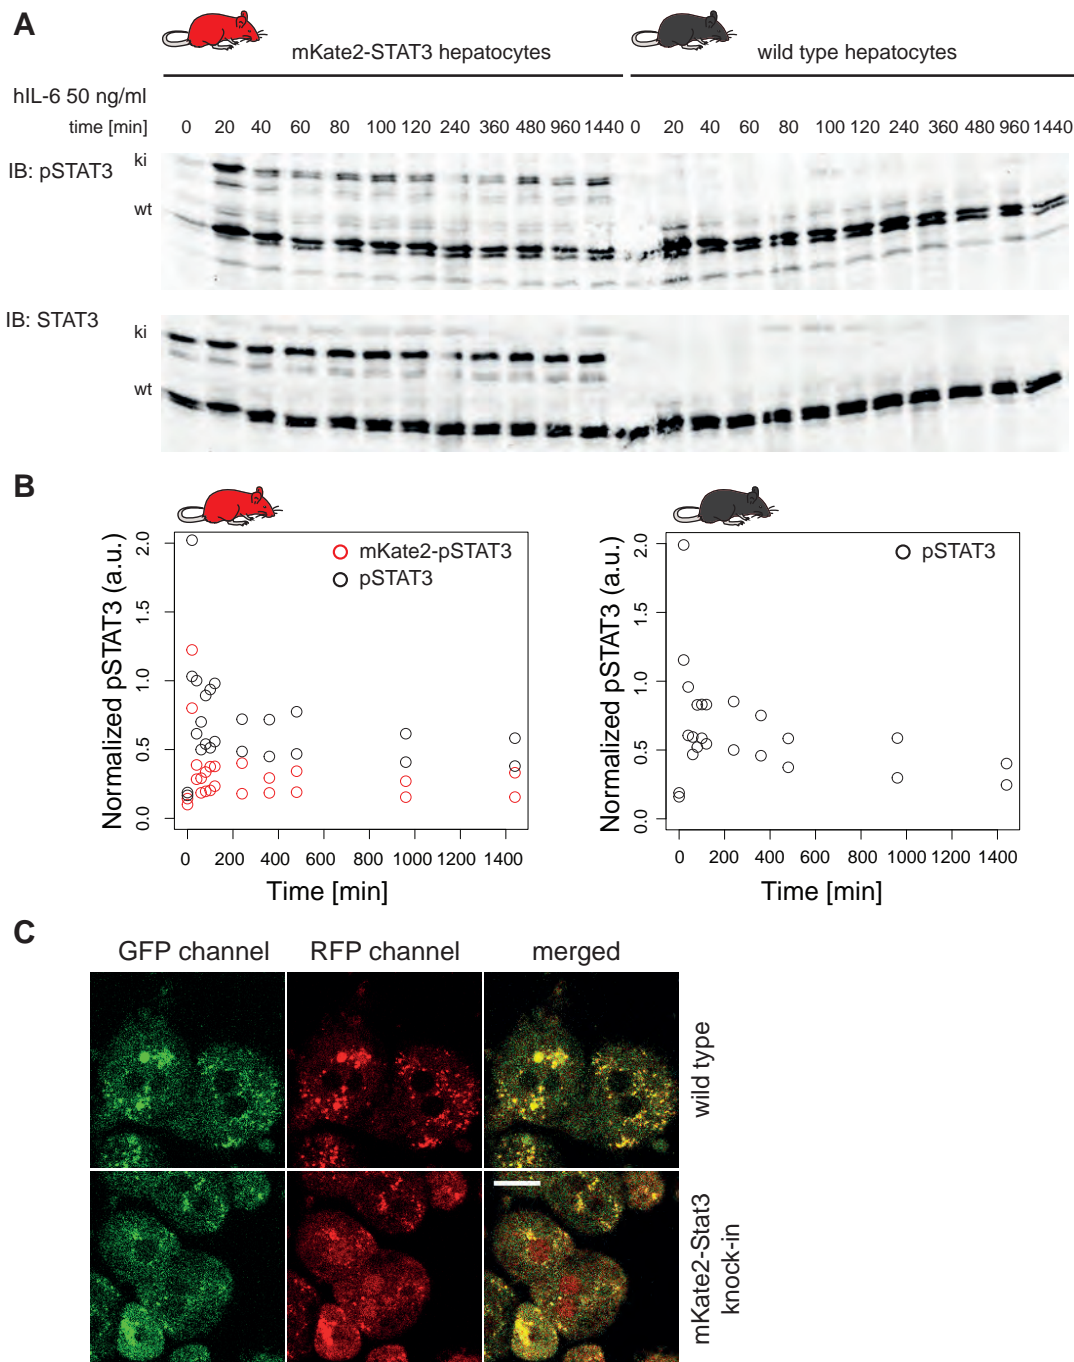

Figure S13: (A) Primary mouse hepatocytes were isolated from both wild type and Stat3 knock-in mice and 2×10^6 cells were seeded per 6-cm dish, were permitted to adhere for four hours, and were serumdepleted overnight. Six hours after serum and dexamethasone depletion, cells were stimulated with 50 ng/ml hIL-6 and lysed with RIPA total cell lysis buffer at indicated time points. Protein lysates were separated by SDS-PAGE and immunoblotting was performed with anti-phosphorylated STAT3 (Y705) and anti-STAT3 antibody. Fluorescent dye-conjugated secondary antibodies were used to amplify the signal and the Odyssey system was employed to detect fluorescent signals. (B) Quantification of Y705 phosphorylation signals of STAT3 shown in A. Phosphorylated STAT3 signals were normalized to total STAT3 signals. Normalized pSTAT3 data were plotted (n=2). (C) Primary mouse hepatocytes were isolated from both wild type and mKate2-Stat3 knock-in mice and seeded in Collagen IV-coated 8-well ibidi plates (2×10^4 cells/well). Four hours after adhesion, the hepatocytes were subjected to confocal microscopy to measure the expression and localization of mKate2-STAT3. Shown are representative images of hepatocytes with mKate2-STAT3 localized to the nuclei from two experiments performed independently (n=2). The scale bar is 50 μ m.

2.14 Figure S14

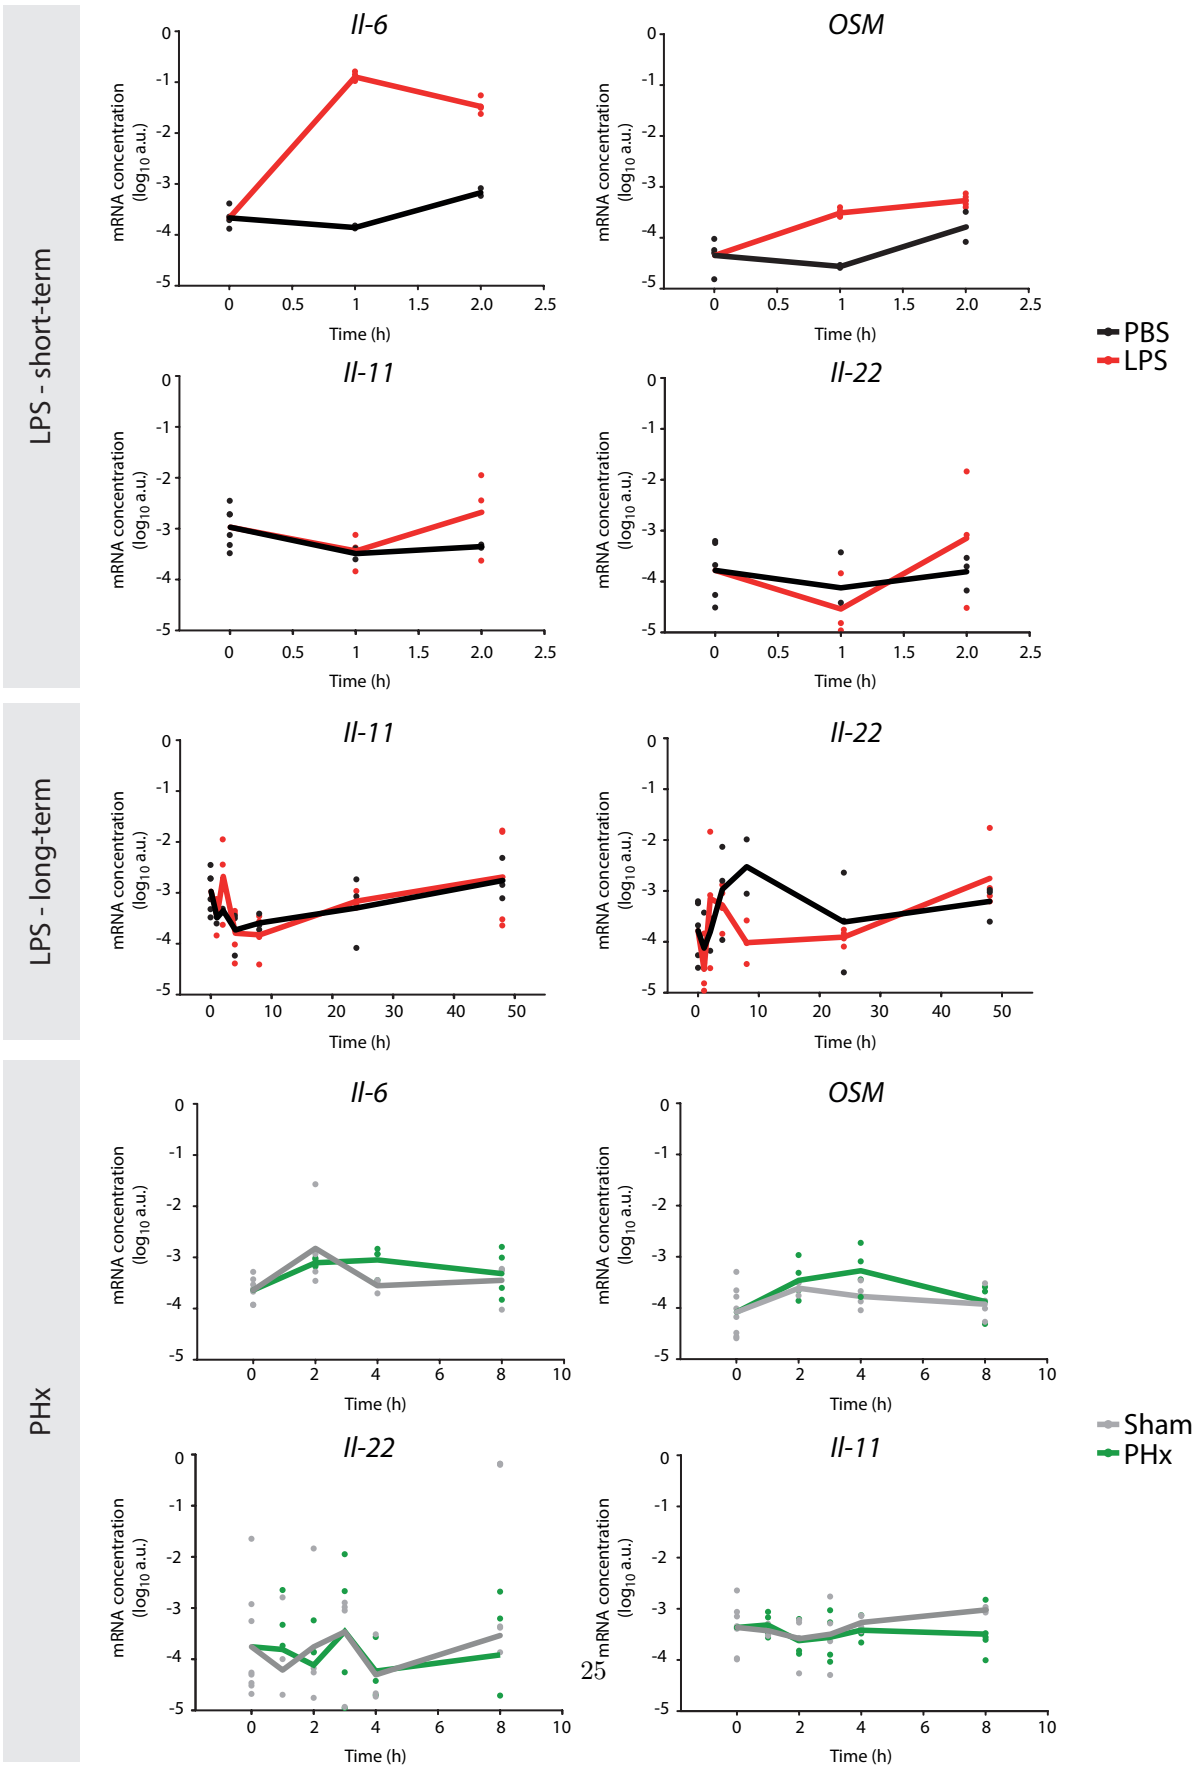

Figure S14: Mice were subjected to control (Sham) surgery or partial hepatectomy (PHx), and control (PBS) or lipopolysaccharide (LPS, 1 µg/g body weight) treatment. Liver lysates were collected at indicated time points subjected to qPCR analysis of indicated cytokines.

3 Mathematical Modeling

3.1 Model Description

The model used in this study is based on a system of Ordinary Differential Equations (ODE). These ordinary differential equations are derived by means of the law of mass-action. The time evolution of the biochemical compounds is computed by numerically integrating these differential equations. The model contains parameters which are estimated by calibrating the model to data using a Maximum-Likelihood estimation approach. Prior to stimulation, the cells are assumed to be in a resting (i.e. unstimulated) state. To achieve such an initial steady state, dynamic variables in the model (see Table S4) are pre-equilibrated prior to each simulation experiment. Model pre-equilibration was performed by simulating until the right hand side of the differential equations dropped below the equilibration threshold (1×10^{-10}). All analyses were performed using the *Data 2 Dynamics* software package [3], which is available from <http://data2dynamics.org>. The model considers two compartments namely cytoplasm (volume = 12.67 pl) and nucleus (volume = 0.5 pl) of primary mouse hepatocytes [1], which are taken into account by considering the relevant compartment volumes in the flux expressions. The 35 dynamic variables used in the model are summarized in Table S4, while the 4 external inputs variables are summarized in Table S5.

The model consists of 35 differential equations, which are given by the following equations:

$$\begin{aligned} d[\text{JAK1_gp130}]/dt &= v_1 - v_2 - v_5 + v_7 + v_8 - v_9 & (1) \\ d[\text{pJAK1_gp130}]/dt &= -v_4 + v_5 - v_6 - v_7 - v_{10} & (2) \\ d[\text{pJAK1_pgp130}]/dt &= -v_3 + v_6 - v_8 - v_{11} & (3) \\ d[\text{STAT3}]/dt &= -v_{12} + v_{13} \cdot \frac{V_{\text{nuc}}}{V_{\text{cyt}}} - v_{14} & (4) \\ d[\text{tpSTAT3}]/dt &= v_{14} - v_{15} & (5) \\ d[\text{nSTAT3}]/dt &= v_{12} \cdot \frac{V_{\text{cyt}}}{V_{\text{nuc}}} - v_{13} + v_{15} \cdot \frac{V_{\text{cyt}}}{V_{\text{nuc}}} & (6) \\ d[\text{nSOCS3RNA1}]/dt &= v_{16} - v_{17} & (7) \\ d[\text{nSOCS3RNA2}]/dt &= v_{17} - v_{18} & (8) \\ d[\text{nSOCS3RNA3}]/dt &= v_{18} - v_{19} & (9) \\ d[\text{nSOCS3RNA4}]/dt &= v_{19} - v_{20} & (10) \\ \\ d[\text{nSOCS3RNA5}]/dt &= v_{20} - v_{21} & (11) \\ d[\text{SOCS3RNA}]/dt &= v_{21} \cdot \frac{V_{\text{nuc}}}{V_{\text{cyt}}} - v_{22} & (12) \\ d[\text{SOCS3}]/dt &= -v_9 - v_{10} - v_{11} + v_{23} - v_{24} & (13) \\ d[\text{nIL33RNA1}]/dt &= v_{41} - v_{42} & (14) \\ d[\text{nIL33RNA2}]/dt &= v_{42} - v_{43} & (15) \\ d[\text{nIL33RNA3}]/dt &= v_{43} - v_{44} & (16) \\ d[\text{nIL33RNA4}]/dt &= v_{44} - v_{45} & (17) \\ d[\text{nIL33RNA5}]/dt &= v_{45} - v_{46} & (18) \\ d[\text{nCXCL10RNA1}]/dt &= v_{25} - v_{31} & (19) \\ d[\text{nCXCL10RNA2}]/dt &= v_{31} - v_{32} & (20) \\ \\ d[\text{nCXCL10RNA3}]/dt &= v_{32} - v_{33} & (21) \\ d[\text{nFGGRNA1}]/dt &= v_{26} - v_{36} & (22) \\ d[\text{nFGGRNA2}]/dt &= v_{36} - v_{37} & (23) \\ d[\text{nFGGRNA3}]/dt &= v_{37} - v_{38} & (24) \\ d[\text{nFGGRNA4}]/dt &= v_{38} - v_{39} & (25) \\ d[\text{nFGGRNA5}]/dt &= v_{39} - v_{40} & (26) \\ d[\text{nHPRNA1}]/dt &= v_{29} - v_{35} & (27) \\ d[\text{nHPXRNA1}]/dt &= v_{30} - v_{34} & (28) \\ d[\text{CXCL10RNA}]/dt &= v_{33} \cdot \frac{V_{\text{nuc}}}{V_{\text{cyt}}} - v_{47} & (29) \\ d[\text{FGGRNA}]/dt &= v_{40} \cdot \frac{V_{\text{nuc}}}{V_{\text{cyt}}} - v_{48} & (30) \\ \\ d[\text{HAMPRNA}]/dt &= v_{27} - v_{49} & (31) \\ d[\text{IL33RNA}]/dt &= v_{46} \cdot \frac{V_{\text{nuc}}}{V_{\text{cyt}}} - v_{50} & (32) \\ d[\text{APCSRNA}]/dt &= v_{28} - v_{51} & (33) \\ d[\text{HPRNA}]/dt &= v_{35} \cdot \frac{V_{\text{nuc}}}{V_{\text{cyt}}} - v_{52} & (34) \\ d[\text{HPXRNA}]/dt &= v_{34} \cdot \frac{V_{\text{nuc}}}{V_{\text{cyt}}} - v_{53} & (35) \end{aligned}$$

Based on numerical integration of these equations, 10 derived quantities are computed:

$$[\text{tgp130}](t) = [\text{JAK1_gp130}] + [\text{pJAK1_gp130}] + [\text{pJAK1_pgp130}] \quad (36)$$

$$[\text{pJAK1}](t) = [\text{pJAK1_gp130}] + [\text{pJAK1_pgp130}] \quad (37)$$

$$[\text{pgp130}](t) = [\text{pJAK1_pgp130}] \quad (38)$$

$$[\text{tSOCS3}](t) = [\text{SOCS3}] \quad (39)$$

$$[\text{npSTAT3}](t) = \frac{\text{stat3_imp} \cdot [\text{tpSTAT3}] \cdot V_{\text{cyt}} \cdot (f_{\text{pstat3_imp}} + 1)}{V_{\text{nuc}}} \quad (40)$$

$$[\text{pSTAT3}](t) = [\text{tpSTAT3}] \quad (41)$$

$$[\text{pSTAT3rel}](t) = \frac{[\text{pSTAT3}]}{[\text{STAT3}] + [\text{pSTAT3}]} \quad (42)$$

$$[\text{tSTAT3}](t) = \frac{[\text{STAT3}] \cdot V_{\text{cyt}} + [\text{nSTAT3}] \cdot V_{\text{nuc}} + [\text{pSTAT3}] \cdot V_{\text{cyt}}}{V_{\text{cyt}} + V_{\text{nuc}}} \quad (43)$$

$$[\text{ctSTAT3}](t) = [\text{STAT3}] + [\text{pSTAT3}] \quad (44)$$

$$[\text{ntSTAT3}](t) = [\text{nSTAT3}] \quad (45)$$

$$(46)$$

The flux expressions corresponding to these equations are provided in Table S6. Most of these equations were based on mass action kinetics. Additional information is provided for the following equations: Equation 5 combines a basal activation term with an active activation term that depends on the concentration of the ligand IL-6. This activation is allosterically inhibited by Ruxolitinib whose inhibitory effect is assumed to be due to blockage of the JAK1 kinase domain (binding is assumed to be in rapid equilibrium). Equation 6 represents further activation of the receptor; which is also inhibited (analogously to 5) by Ruxolitinib. Equation 14 represents a phenomenological description of the phosphorylation and dimerization of STAT3. Here SOCS3 inhibits the activated receptor by reducing its accessibility (lower apparent concentration), while STAT3 is inhibited by the drug Stattic. Equation 25 to 29 represent a phenomenological description of mRNA transcription initiation in the form of Hill kinetics, while equation 16, 30 and 41 represent a reduced form of this equation. Hill kinetics are often used to describe such processes [4]. ActD is assumed to fully inhibit all transcriptional activity (hence the (1-ActD) terms in all equations reflecting transcriptional activity).

The system of ODEs was integrated using the CVODES algorithm from the SUNDIALS suite of solvers [5]. First order derivatives were computed using the sensitivity equations and used for numerical optimization. Relative and absolute tolerances were both set to 1×10^{-8} .

Table S4: Dynamic variables used in the model. Note that all dynamic variables are simulated to steady state prior to perturbation in all of the simulation experiments.

| Variable | Unit | Compartment | Initial Condition | Description |
|--------------|----------------|-------------|---------------------|------------------------------|
| JAK1_gp130 | conc. [nmol/l] | cyt | gp130_pro/gp130_deg | Unphosphorylated receptor |
| pJAK1_gp130 | conc. [au] | cyt | 0 | Phosphorylated JAK1 receptor |
| pJAK1_pgp130 | conc. [au] | cyt | 0 | Active receptor |
| STAT3 | conc. [nmol/l] | cyt | 0 | Inactive cytoplasmic STAT3 |
| tpSTAT3 | conc. [nmol/l] | cyt | 0 | Active STAT3 |

Table S5: Inputs used in the model

| Input | Unit | Default equation | Description |
|-------------|------------------|--|---------------|
| IL6 | conc. [ng/ml] | input_il6 · heaviside(t) | Interleukin 6 |
| ActD | boolean [on/off] | input_actd · heaviside(t + 10) | Actinomycin D |
| Stattic | conc. [μmol/l] | input_stattic · heaviside(t + 60) | Stattic |
| Ruxolitinib | conc. [nmol/l] | input_ruxolitinib · heaviside(t + 60) · e ^{-rux.degrade·(t+60)} | Ruxolitinib |

Table S6: Model flux expressions

| Flux | Equation | Description |
|----------|---|---|
| v_1 | $-\text{gp130_pro} \cdot ([\text{ActD}] - 1)$ | Receptor production |
| v_2 | $[\text{JAK1_gp130}] \cdot \text{gp130_deg}$ | Receptor degradation |
| v_3 | $\text{gp130_deg} \cdot [\text{pJAK1_pgp130}]$ | Receptor degradation |
| v_4 | $\text{gp130_deg} \cdot [\text{pJAK1_gp130}]$ | Receptor degradation |
| v_5 | $\frac{[\text{JAK1_gp130}] \cdot (\text{jak1_act_basal} + [\text{IL6}] \cdot \text{jak1_act_il6})}{[\text{Ruxolitinib}] \cdot \text{jak1_inh_ruxolitinib} + 1}$ | Activation of the JAK1 receptor |
| v_6 | $\frac{\text{gp130_act_jak1} \cdot [\text{pJAK1_gp130}]}{[\text{Ruxolitinib}] \cdot \text{jak1_inh_ruxolitinib} + 1}$ | Activation of the gp130 subunit |
| v_7 | $\text{jak1_gp130_dea} \cdot [\text{pJAK1_gp130}]$ | Receptor dephosphorylation |
| v_8 | $\text{jak1_gp130_dea} \cdot [\text{pJAK1_pgp130}]$ | Receptor dephosphorylation |
| v_9 | $[\text{JAK1_gp130}] \cdot [\text{SOCS3}] \cdot \text{socs3_assoc}$ | SOCS3 mediated degradation |
| v_{10} | $[\text{SOCS3}] \cdot [\text{pJAK1_gp130}] \cdot \text{socs3_assoc}$ | SOCS3 mediated degradation |
| v_{11} | $[\text{SOCS3}] \cdot [\text{pJAK1_pgp130}] \cdot \text{socs3_assoc}$ | SOCS3 mediated degradation |
| v_{12} | $[\text{STAT3}] \cdot \text{stat3_imp}$ | Import of unphosphorylated STAT3 |
| v_{13} | $[\text{nSTAT3}] \cdot \text{stat3_exp}$ | Export of unphosphorylated STAT3 |
| v_{14} | $\frac{[\text{STAT3}] \cdot [\text{pJAK1_pgp130}] \cdot \text{stat3_act_gp130}}{([\text{SOCS3}] \cdot \text{stat3_inh_socs3} + 1) \cdot ([\text{Stat3}] \cdot \text{stat3_inh_stactic} + 1)}$ | STAT3 phosphorylation and dimerization |
| v_{15} | $\text{stat3_imp} \cdot [\text{tpSTAT3}] \cdot (\text{f_pstat3_imp} + 1)$ | STAT3 import and deactivation |
| v_{16} | $-\text{socs3rna_pro} \cdot ([\text{ActD}] - 1) \cdot \frac{(\text{stat3_imp} \cdot [\text{tpSTAT3}] \cdot V_{\text{cyt}} \cdot (\text{f_pstat3_imp} + 1))}{V_{\text{nuc}}}$ | Initiation of SOCS3 mRNA transcription |
| v_{17} | $[\text{nSOCS3RNA1}] \cdot \text{socs3rna_delay}$ | Transcriptional delay |
| v_{18} | $[\text{nSOCS3RNA2}] \cdot \text{socs3rna_delay}$ | Transcriptional delay |
| v_{19} | $[\text{nSOCS3RNA3}] \cdot \text{socs3rna_delay}$ | Transcriptional delay |
| v_{20} | $[\text{nSOCS3RNA4}] \cdot \text{socs3rna_delay}$ | Transcriptional delay |
| v_{21} | $[\text{nSOCS3RNA5}] \cdot \text{socs3rna_delay}$ | Transcriptional delay |
| v_{22} | $[\text{SOCS3RNA}] \cdot \text{socs3rna_des}$ | SOCS3 mRNA degradation |
| v_{23} | $[\text{SOCS3RNA}] \cdot \text{socs3_pro}$ | SOCS3 mRNA translation |
| v_{24} | $[\text{SOCS3}] \cdot \text{socs3_des}$ | SOCS3 degradation |
| v_{25} | $\frac{\text{cxcl10rna_pro} \cdot ([\text{ActD}] - 1)}{(\frac{\text{cxcl10rna_ka} \cdot V_{\text{nuc}}}{(\text{stat3_imp} \cdot [\text{tpSTAT3}] \cdot V_{\text{cyt}} \cdot (\text{f_pstat3_imp} + 1))} + 1)}$ | Initiation of CXCL10 mRNA transcription |
| v_{26} | $\frac{\text{fggrna_pro} \cdot ([\text{ActD}] - 1)}{(\frac{\text{fggrna_ka} \cdot V_{\text{nuc}}}{(\text{stat3_imp} \cdot [\text{tpSTAT3}] \cdot V_{\text{cyt}} \cdot (\text{f_pstat3_imp} + 1))} + 1)}$ | Initiation of FGGRNA transcription |
| v_{27} | $\frac{\text{hamprna_pro} \cdot ([\text{ActD}] - 1)}{(\frac{\text{hamprna_ka} \cdot V_{\text{nuc}}}{(\text{stat3_imp} \cdot [\text{tpSTAT3}] \cdot V_{\text{cyt}} \cdot (\text{f_pstat3_imp} + 1))} + 1)}$ | Initiation of HAMP mRNA transcription |
| v_{28} | $\frac{\text{apcsrna_pro} \cdot ([\text{ActD}] - 1)}{(\frac{\text{apcsrna_ka} \cdot V_{\text{nuc}}}{(\text{stat3_imp} \cdot [\text{tpSTAT3}] \cdot V_{\text{cyt}} \cdot (\text{f_pstat3_imp} + 1))} + 1)}$ | Initiation of APCS mRNA transcription |
| v_{29} | $\frac{\text{hprna_pro} \cdot ([\text{ActD}] - 1)}{(\frac{\text{hprna_ka} \cdot V_{\text{nuc}}}{(\text{stat3_imp} \cdot [\text{tpSTAT3}] \cdot V_{\text{cyt}} \cdot (\text{f_pstat3_imp} + 1))} + 1)}$ | Initiation of HP mRNA transcription |
| v_{30} | $-\text{hpxrna_pro} \cdot ([\text{ActD}] - 1) \cdot \frac{(\text{stat3_imp} \cdot [\text{tpSTAT3}] \cdot V_{\text{cyt}} \cdot (\text{f_pstat3_imp} + 1))}{V_{\text{nuc}}}$ | Initiation of HPX mRNA transcription |
| v_{31} | $\text{cxcl10rna_delay} \cdot [\text{nCXCL10RNA1}]$ | Transcriptional delay |
| v_{32} | $\text{cxcl10rna_delay} \cdot [\text{nCXCL10RNA2}]$ | Transcriptional delay |
| v_{33} | $\text{cxcl10rna_delay} \cdot [\text{nCXCL10RNA3}]$ | Transcriptional delay |
| v_{34} | $\text{hpxrna_delay} \cdot [\text{nHPXRNA1}]$ | Transcriptional delay |
| v_{35} | $\text{hprna_delay} \cdot [\text{nHPRNA1}]$ | Transcriptional delay |
| v_{36} | $\text{fggrna_delay} \cdot [\text{nFGGRNA1}]$ | Transcriptional delay |
| v_{37} | $\text{fggrna_delay} \cdot [\text{nFGGRNA2}]$ | Transcriptional delay |
| v_{38} | $\text{fggrna_delay} \cdot [\text{nFGGRNA3}]$ | Transcriptional delay |
| v_{39} | $\text{fggrna_delay} \cdot [\text{nFGGRNA4}]$ | Transcriptional delay |
| v_{40} | $\text{fggrna_delay} \cdot [\text{nFGGRNA5}]$ | Transcriptional delay |
| v_{41} | $-\text{il33rna_pro} \cdot ([\text{ActD}] - 1) \cdot \frac{(\text{stat3_imp} \cdot [\text{tpSTAT3}] \cdot V_{\text{cyt}} \cdot (\text{f_pstat3_imp} + 1))}{V_{\text{nuc}}}$ | Initiation of IL33 mRNA transcription |
| v_{42} | $\text{il33rna_delay} \cdot [\text{nIL33RNA1}]$ | Transcriptional delay |
| v_{43} | $\text{il33rna_delay} \cdot [\text{nIL33RNA2}]$ | Transcriptional delay |

| v_{47} | $[\text{CXCL10RNA}] \cdot \text{cxcl10rna_des}$ | CXCL10 degradation |
| v_{48} | $[\text{FGGRNA}] \cdot \text{fggrna_des}$ | FGGRNA degradation |
| v_{49} | $[\text{HAMP RNA}] \cdot \text{hamprna_des}$ | HAMP degradation |
| v_{50} | $[\text{IL33RNA}] \cdot \text{il33rna_des}$ | IL33 degradation |
| v_{51} | $[\text{APCSRNA}] \cdot \text{apcsrna_des}$ | APCSRNA degradation |
| v_{52} | $[\text{HPRNA}] \cdot \text{hprna_des}$ | HP degradation |
| v_{53} | $[\text{HPXRNA}] \cdot \text{hpxrna_des}$ | Transcriptional delay |

3.2 Observables

The model contains 18 standard observables listed in table S7. Certain experiments may contain experiment specific observation functions, which are detailed in the experiment section (see 4).

Table S7: Model observables and error models

| Observable | Equations |
|--|---|
| pJAK1 Western blot [au] | $y \log_{10}(\text{offset_pjak1_wb_filename} + [\text{pJAK1}] \cdot \text{scale_pjak1_wb_filename})$ $\sigma \text{sd_pjak1_wb_filename}$ |
| pgp130 Western blot [au] | $y \log_{10}(\text{offset_pgp130_wb_filename} + [\text{pgp130}] \cdot \text{scale_pgp130_wb_filename})$ $\sigma \text{sd_pgp130_wb_filename}$ |
| pSTAT3 Western blot [au] | $y \log_{10}(\text{offset_pstat3_wb_filename} + [\text{pSTAT3}] \cdot \text{scale_pstat3_wb_filename})$ $\sigma \text{sd_pstat3_wb_filename}$ |
| pSTAT3 [au] | $y \log_{10}(\text{offset_pstat3_lumi_filename} + [\text{pSTAT3}] \cdot \text{scale_pstat3_lumi_filename})$ $\sigma \text{sd_pstat3_lumi_filename}$ |
| pSTAT3 Western blot [au] | $y \log_{10}(\text{offset_npstat3_wb_filename} + [\text{npSTAT3}] \cdot \text{scale_npstat3_wb_filename})$ $\sigma \text{sd_npstat3_wb_filename}$ |
| SOCS3 Western blot [au] | $y \log_{10}(\text{offset_socs3_wb_filename} + \text{scale_socs3_wb_filename} \cdot [\text{tSOCS3}])$ $\sigma \text{sd_socs3_wb_filename}$ |
| SOCS3 qPCR [au] | $y \log_{10}(\text{offset_socs3_qpcr_filename} + [\text{SOCS3RNA}] \cdot \text{scale_socs3_qpcr_filename})$ $\sigma \text{sd_socs3_qpcr_filename}$ |
| Total nuclear STAT3 [au] | $y \log_{10}(\frac{[\text{ntSTAT3}]}{[\text{STAT3}] + [\text{pSTAT3}]})$ $\sigma \text{sd_ntstat3_ratio_filename}$ |
| JAK1_gp130 complex molecules per cell [nmol/l] | $y \log_{10}([\text{tgp130}])$ $\sigma \text{sd_JAK1_gp130_abs}$ |
| Cytoplasmic STAT3 molecules per cell [nmol/l] | $y \log_{10}([\text{ctSTAT3}])$ $\sigma \text{sd_ctSTAT3_abs}$ |
| SOCS3 molecules per cell [nmol/l] | $y \log_{10}([\text{tSOCS3}])$ $\sigma \text{sd_SOCS3_abs}$ |
| CXCL10 qPCR [au] | $y \log_{10}(\text{offset_cxcl10_qpcr_filename} + [\text{CXCL10RNA}] \cdot \text{scale_cxcl10_qpcr_filename})$ $\sigma \text{sd_cxcl10_qpcr}$ |
| FGG qPCR [au] | $y \log_{10}(\text{offset_fgg_qpcr_filename} + [\text{FGGRNA}] \cdot \text{scale_fgg_qpcr_filename})$ $\sigma \text{sd_fgg_qpcr}$ |
| HAMP qPCR [au] | $y \log_{10}(\text{offset_hamp_qpcr_filename} + [\text{HAMPRNA}] \cdot \text{scale_hamp_qpcr_filename})$ $\sigma \text{sd_hamp_qpcr}$ |
| IL33 qPCR [au] | $y \log_{10}(\text{offset_il33_qpcr_filename} + [\text{IL33RNA}] \cdot \text{scale_il33_qpcr_filename})$ $\sigma \text{sd_il33_qpcr}$ |
| APCS qPCR [au] | $y \log_{10}(\text{offset_apcs_qpcr_filename} + [\text{APCSRNA}] \cdot \text{scale_apcs_qpcr_filename})$ $\sigma \text{sd_apcs_qpcr}$ |
| HP qPCR [au] | $y \log_{10}(\text{offset_hp_qpcr_filename} + [\text{HPRNA}] \cdot \text{scale_hp_qpcr_filename})$ $\sigma \text{sd_hp_qpcr}$ |
| HPX qPCR [au] | $y \log_{10}(\text{offset_hpx_qpcr_filename} + [\text{HPXRNA}] \cdot \text{scale_hpx_qpcr_filename})$ $\sigma \text{sd_hpx_qpcr}$ |

3.3 Default Parameter Transformations

Some of the bare model parameters are transformed before each simulation experiment. This is done both to facilitate fitting (e.g. decoupling scale from dynamics), but also to allow condition specific parameter changes. The ODE system is modified by the following parameter transformations:

$$\text{apcsrna_pro} \rightarrow \frac{\text{apcsrna_pro}}{\text{scale_apcs_qpcr_37}} \quad (47)$$

$$\text{cxcl10rna_pro} \rightarrow \frac{\text{cxcl10rna_pro}}{\text{scale_cxcl10_qpcr_31}} \quad (48)$$

$$\text{fggrna_pro} \rightarrow \frac{\text{fggrna_pro}}{\text{scale_fgg_qpcr_34}} \quad (49)$$

$$\text{hamprna_pro} \rightarrow \frac{\text{hamprna_pro}}{\text{scale_hamp_qpcr_34}} \quad (50)$$

$$\text{hprna_pro} \rightarrow \frac{\text{hprna_pro}}{\text{scale_hp_qpcr_37}} \quad (51)$$

$$\text{hpxrna_pro} \rightarrow \frac{\text{hpxrna_pro}}{\text{scale_hpx_qpcr_37}} \quad (52)$$

$$\text{il33rna_pro} \rightarrow \frac{\text{il33rna_pro}}{\text{scale_il33_qpcr_34}} \quad (53)$$

$$\text{init_JAK1_gp130} \rightarrow \frac{\text{gp130_pro}}{\text{gp130_deg}} \quad (54)$$

$$\text{init_nSTAT3} \rightarrow \text{total_STAT3} \quad (55)$$

$$\text{input_actd} \rightarrow 0 \quad (56)$$

$$\text{input_il6} \rightarrow 40 \quad (57)$$

$$\text{input_ruxolitinib} \rightarrow 0 \quad (58)$$

$$\text{input_stattic} \rightarrow 0 \quad (59)$$

$$\text{jak1_act_basal} \rightarrow \frac{\text{jak1_act_basal}}{\text{scale_pgp130_wb_6}} \quad (60)$$

$$\text{jak1_act_il6} \rightarrow \frac{\text{jak1_act_il6}}{\text{scale_pgp130_wb_6}} \quad (61)$$

$$\text{scale_npstat3_wb_filename} \rightarrow \frac{\text{scale_npstat3_wb_filename}}{\text{total_STAT3}} \quad (62)$$

$$\text{scale_pstat3_lumi_filename} \rightarrow \frac{\text{scale_pstat3_lumi_filename}}{\text{total_STAT3}} \quad (63)$$

$$\text{scale_pstat3_wb_filename} \rightarrow \frac{\text{scale_pstat3_wb_filename}}{\text{total_STAT3}} \quad (64)$$

$$\text{socs3_pro} \rightarrow \text{scale_socs3_qpcr_52} \cdot \text{socs3_pro} \quad (65)$$

$$\text{socs3rna_pro} \rightarrow \frac{\text{socs3rna_pro}}{\text{scale_socs3_qpcr_52}} \quad (66)$$

$$\text{stat3_act_gp130} \rightarrow \text{scale_pgp130_wb_6} \cdot \text{stat3_act_gp130} \quad (67)$$

$$V_{\text{cyt}} \rightarrow 12.67 \quad (68)$$

$$V_{\text{nuc}} \rightarrow 0.5 \quad (69)$$

$$(70)$$

3.4 Dynamic Parameters

In total 656 parameters are estimated from the experimental data based on a total of 4508 data points. The model parameters were estimated by maximum likelihood estimation applying the MATLAB lsqnonlin algorithm. The model parameters which influence system dynamics are listed in Table S8. Parameters highlighted in red color indicate parameter values close to their bounds. An extensive list of all the estimated parameters (including all observational and error model parameters) is given in section 5. These can be found in Table S102 – S116.

| | name | θ_{min} | $\hat{\theta}$ | θ_{max} | log | non-log $\hat{\theta}$ | fitted |
|-----|----------------------|----------------|----------------|----------------|-----|------------------------|--------|
| 141 | apcsrna_des | -5 | -2.9749 | +5 | 1 | $+1.06 \cdot 10^{-03}$ | 1 |
| 142 | apcsrna_hill | -5 | +0.6266 | +5 | 1 | $+4.23 \cdot 10^{+00}$ | 1 |
| 143 | apcsrna_ka | -5 | +1.6998 | +5 | 1 | $+5.01 \cdot 10^{+01}$ | 1 |
| 144 | apcsrna_pro | -5 | -2.8555 | +5 | 1 | $+1.39 \cdot 10^{-03}$ | 1 |
| 145 | cxcl10rna_delay | -5 | -1.3446 | +5 | 1 | $+4.52 \cdot 10^{-02}$ | 1 |
| 146 | cxcl10rna_des | -5 | -1.3448 | +5 | 1 | $+4.52 \cdot 10^{-02}$ | 1 |
| 147 | cxcl10rna_hill | -5 | +0.9890 | +5 | 1 | $+9.75 \cdot 10^{+00}$ | 1 |
| 148 | cxcl10rna_ka | -5 | +2.1546 | +5 | 1 | $+1.43 \cdot 10^{+02}$ | 1 |
| 149 | cxcl10rna_pro | -5 | +0.7548 | +5 | 1 | $+5.69 \cdot 10^{+00}$ | 1 |
| 150 | f_pstat3_imp | +0 | +4.9712 | +100 | 0 | $+4.97 \cdot 10^{+00}$ | 1 |
| 151 | fggrna_delay | -5 | -0.9180 | +5 | 1 | $+1.21 \cdot 10^{-01}$ | 1 |
| 152 | fggrna_des | -5 | -2.1131 | +5 | 1 | $+7.71 \cdot 10^{-03}$ | 1 |
| 153 | fggrna_hill | -5 | +0.5952 | +5 | 1 | $+3.94 \cdot 10^{+00}$ | 1 |
| 154 | fggrna_ka | -5 | +1.6916 | +5 | 1 | $+4.92 \cdot 10^{+01}$ | 1 |
| 155 | fggrna_pro | -5 | -0.6278 | +5 | 1 | $+2.36 \cdot 10^{-01}$ | 1 |
| 156 | gp130_act_jak1 | -15 | -0.2700 | +6 | 1 | $+5.37 \cdot 10^{-01}$ | 1 |

Table S8: Estimated dynamic parameter values

$\hat{\theta}$ indicates the estimated value of the parameters. θ_{min} and θ_{max} indicate the upper and lower bounds for the parameters. The log-column indicates if the value of a parameter was log-transformed. If log = 1 the non-log-column indicates the non-logarithmic value of the estimate. The fitted-column indicates if the parameter value was estimated (1), was temporarily fixed (0) or if its value was fixed to a constant value (2). 33

3.5 Model Development

Models correspond to simplifications of reality which aid in understanding the phenomena they were developed to describe. It is important to balance model complexity with experimental observations, such that only those aspects of reality on which the observed data has any meaningful information are included in the model. By restricting the model to a minimal number of effects, one can ameliorate predictive uncertainties. The more precise a prediction, the easier it will be to falsify, but also the more we learn when the prediction is not falsified. Models that predict accurately, while still resisting falsification are the most useful. Model development was performed by iteratively performing parameter and uncertainty estimation followed by either model reduction or data acquisition. An important concept here is parameter identifiability. When constructing a model from first principles, it is typically the case that several parameters are non-identifiable, which means they do not have finite confidence intervals. In turn, this leads to large uncertainties in the predictions. It is therefore important to assess the identifiability of the various model parameters and resolve them when they have direct consequences on predictions of interest.

The model was tailored to the data in such a way that the dynamic parameters were identifiable. To assess identifiability, we computed likelihood profiles, which systematically trace an optimal path over the likelihood in order to determine parameter confidence bounds. The algorithm works as follows: Every profile is initiated at the best fit parameters. One parameter is subsequently selected and incrementally sampled over a range while optimizing for all the other parameters. If the parameter is identifiable, the negative log-likelihood will reach a statistical threshold in both directions. If the negative log-likelihood does not reach this bound on either side, then it is not possible to determine a range for the parameter and the parameter is classified as non-identifiable.

In this process of iterative model refinement a few data-based model reduction steps are worth mentioning:

1. Pre-stimulation steady states are determined implicitly, by simulating the system to convergence. As such, the system has no initial condition parameters for moieties which are not conserved and one parameter per conserved moiety to estimate its total pool.
2. Only relative mRNA levels were quantified within this study. Therefore the absolute scale of SOCS3 mRNA is unknown. By non-dimensionalizing those parts of the system, the dynamic parameters were decoupled from the scale of these components. A non-identifiability in the scaling parameters can cause problems when computing profile likelihoods (since extremely low or high values result in numerical difficulties). For this reason, one of the mRNA scaling factors was set to unity, providing a fixed scale for the mRNA levels.
3. The original model contained Hill kinetics for SOCS3 activation. However, profile likelihood analysis revealed that even after fixing the scale of SOCS3 mRNA, the mRNA production rate and microscopic dissociation constant (`socs3_ka`) were non-identifiable. This was the result of a high microscopic dissociation constant (open ended profile towards high rates). For this reason, this part of the rate equation was reformulated as shown in Equation 71, without loss of fidelity to the data.

$$\frac{\text{socs3rna_pro}^{old}}{1 + \left(\frac{\text{socs3rna_ka}}{[\text{npSTAT3}]} \right)^{\text{socs3_hill}}} \rightarrow \frac{\text{socs3rna_pro}^{old}}{\text{socs3rna_ka}^{\text{socs3_hill}} [\text{npSTAT3}]^{\text{socs3_hill}}} \rightarrow \text{socs3rna_pro} [\text{npSTAT3}]^{\text{socs3_hill}} \quad (71)$$

4. Considering that import and export of both phosphorylated and unphosphorylated STAT3 have been suggested to occur in literature [6, 7], the initial model contained import and export parameters for both

phosphorylated and unphosphorylated STAT3. Profile likelihood analysis indicated that nuclear export could be omitted from the model as its contribution was non-observably small. This parameter was removed from the system without incurring any penalty on the data fit.

5. Based on the data, the nuclear dephosphorylation rate was very high (open-ended profile likelihood towards high values). This indicated that no dynamical difference between nuclear pSTAT3 and cytoplasmic pSTAT3 could be observed, despite measurements on both. Considering that nuclear STAT3 dephosphorylation is so rapid that the level of nuclear phosphorylated STAT3 follows the cytoplasmic concentration exactly, the dynamic part of the model was reduced by one equation. The speed at which dephosphorylation occurred in the nucleus also meant that phosphorylated STAT3 in the nucleus contributed a negligible amount to the total of STAT3. Therefore, despite measurements of the absolute number of STAT3 molecules per cell, the absolute scale of nuclear pSTAT3 is unknown. More concretely; the nuclear phosphorylated STAT3 was modelled as the cytoplasmic phosphorylated STAT3 level multiplied by an estimated scaling factor. Aside from resolving non-identifiabilities, step 4 and 5 also reduced the stiffness of the system of ordinary differential equations and resulted in faster simulation times.

6. Based on subsequent profile likelihood analysis, we determined that the import and export rates of unphosphorylated STAT3 were also not fully identifiable. The resulting parameterization contained at least two qualitatively distinct optima. In the first optimum, the import and export of unphosphorylated STAT3 was rapid and the import rate of STAT3 was faster than that of pSTAT3. In the second optimum, the import and export rates of unphosphorylated STAT3 were relatively low (but observably nonzero). We decided to reparameterize the model in such a way that the import rate of the phosphorylated form is always bigger than the unphosphorylated form $pstat3_imp = stat3_imp(1 + f_pstat3_imp)$. This parameter transformation resolved the non-identifiability.

7. Upstream in the model, only a very small fraction of the receptors were phosphorylated. Similarly to nuclear pSTAT3, this meant that the scale of the activated receptors was unknown despite measurements on the total (there was only a meaningful upper bound). As such, the basal and induced activation parameters were practically non-identifiable (no lower bound), and correlated. Again, we verified this by applying a parameter transformation based on non-dimensionalization (dividing the dynamic parameter by the scale of one of the data sets used for parameter estimation). This rendered the dynamical parameter identifiable and the scale non-identifiable.

8. Initially two inhibition mechanisms for Ruxolitinib were included in order to avoid biasing our decision as to where the activity of Ruxolitinib was most pronounced. One was at the receptor level, while the other inhibited the activation of STAT3 directly. While the former parameter was clearly identifiable from the data, the latter mechanism of inhibition was non-identifiable (no lower bound) and could safely be removed without appreciable loss of fit accuracy.

9. The original model contained a SOCS3 inhibition effect on the phosphorylation steps in the model. This caused a fairly strong transient in the concentration of SOCS3 post-peak due to lack of damping. By allowing receptor production and degradation, and explicit SOCS3 binding to the receptor (with its own degradation rate), we obtained a model with a comparable fit but a less extreme post-peak oscillatory transient. This was in better agreement with the data.

10. Profiling the new receptor model showed that the modification at the receptor level introduced a new non-identifiability in the degradation rate of the SOCS3 bound receptor (open ended profiles to positive infinity). Considering that the speed of degradation was not constrained by the available data, this allowed for a model reduction involving the removal of all SOCS3-bound receptor states. In the new model, SOCS3 binding constitutes an additional degradation mechanism for the receptor to be degraded.

11. The initial APP model looked very similar to the model for SOCS3. Delays were implemented using the linear chain trick in which a delay is distributed over multiple steps with identical rates. Increasing

the number of steps in such a linear chain results in a sharper delay, while fewer steps result in smearing of the input signal. An APP model with too many delay steps was characterized by an open ended profile towards positive infinity for the degradation rate of the mRNA (meaning that the mRNA follows the last delayed intermediate exactly). The models for the APP genes were iteratively reduced by reducing the number of delay states until each APP model was identifiable. In the finalized model SOCS3, CXCL10, FGG, IL33, HP and HPX required a delay. Whereas SOCS3, FGG and IL33 required five intermediate delay steps to adequately describe the data, CXCL10 required only three and HP and HPX only a single delay intermediate. HAMP and APCS were sufficiently described without any delay. Similarly to SOCS3, the k_a 's of HPX and IL-33 were non-identifiable and could be removed from the model.

Concluding, the result from these model simplifications is a model where all the dynamical parameters are identifiable. The profile likelihoods corresponding to the dynamical parameters of the core model are shown in Figure S15. The profile likelihoods for the APP genes can be found in S16 to S22. To keep computational time reasonable, and since the APP genes do not feed back into the core model, the APP likelihood profiles were computed keeping the core model (SOCS3/STAT3 axis) parameters fixed. The final estimated parameter values were then incorporated into the full model.

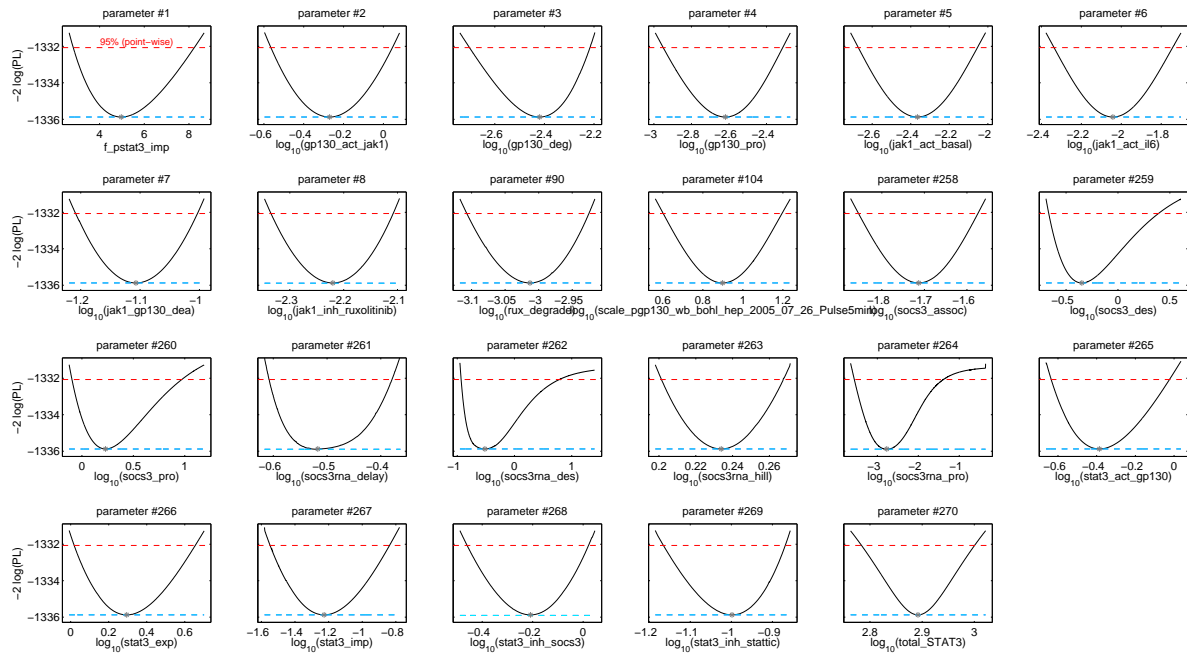

Figure S15: Overview of the profile likelihood of the core model parameters. The solid lines indicate the profile likelihood. The dashed lines indicate the threshold to assess confidence intervals. The asterisks indicate the optimal parameter values.

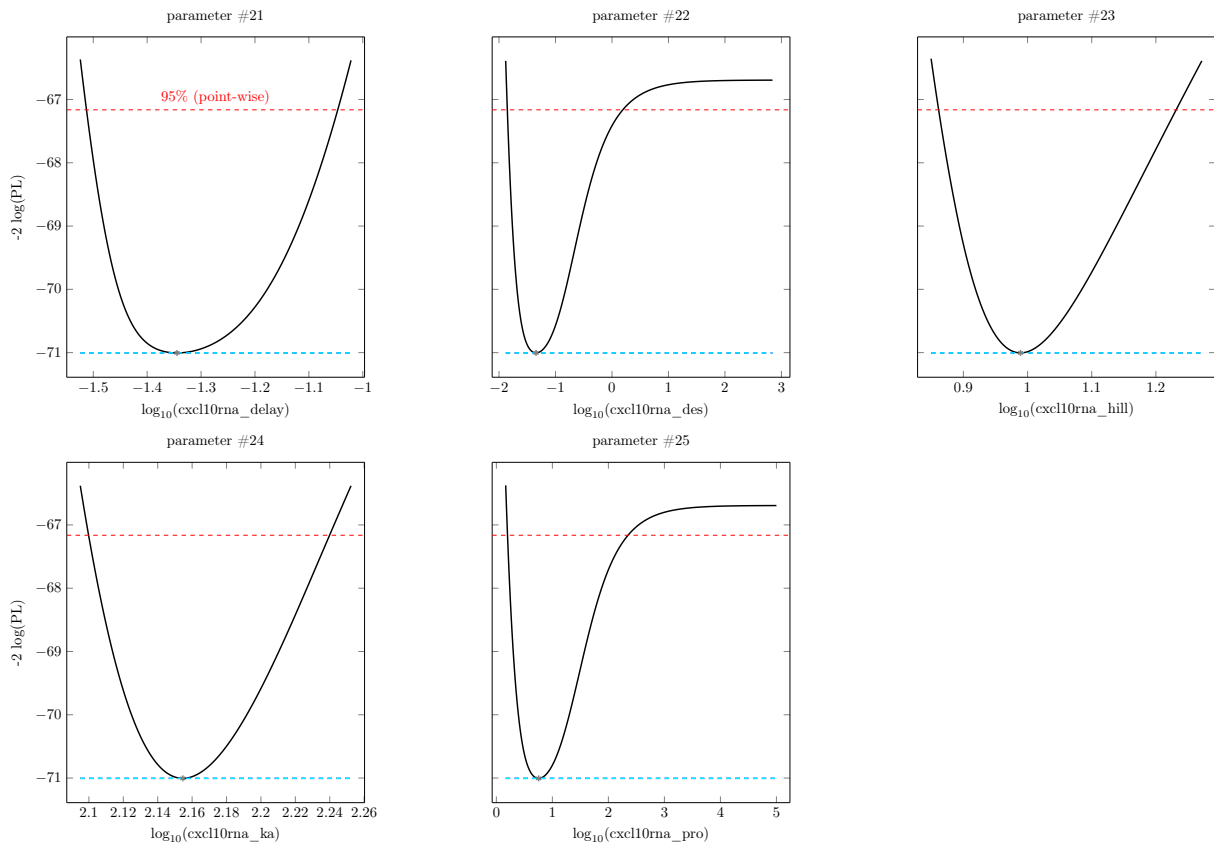

Figure S16: Overview of the profile likelihood of the CXCL10 model parameters. The solid lines indicate the profile likelihood. The dashed lines indicate the threshold to assess confidence intervals. The asterisks indicate the optimal parameter values.

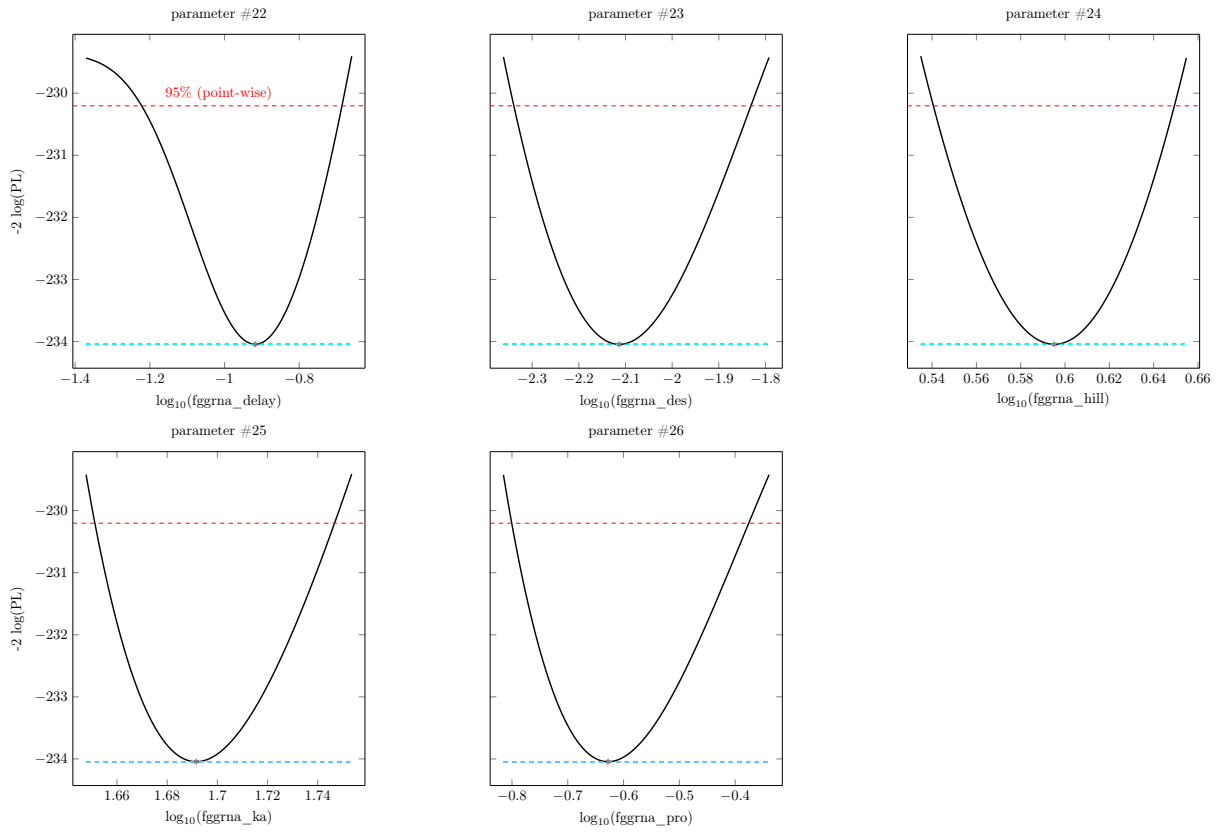

Figure S17: Overview of the profile likelihood of the FGG model parameters. The solid lines indicate the profile likelihood. The dashed lines indicate the threshold to assess confidence intervals. The asterisks indicate the optimal parameter values.

Figure S18: Overview of the profile likelihood of the HAMP model parameters. The solid lines indicate the profile likelihood. The dashed lines indicate the threshold to assess confidence intervals. The asterisks indicate the optimal parameter values.

Figure S19: Overview of the profile likelihood of the IL33 model parameters. The solid lines indicate the profile likelihood. The dashed lines indicate the threshold to assess confidence intervals. The asterisks indicate the optimal parameter values.

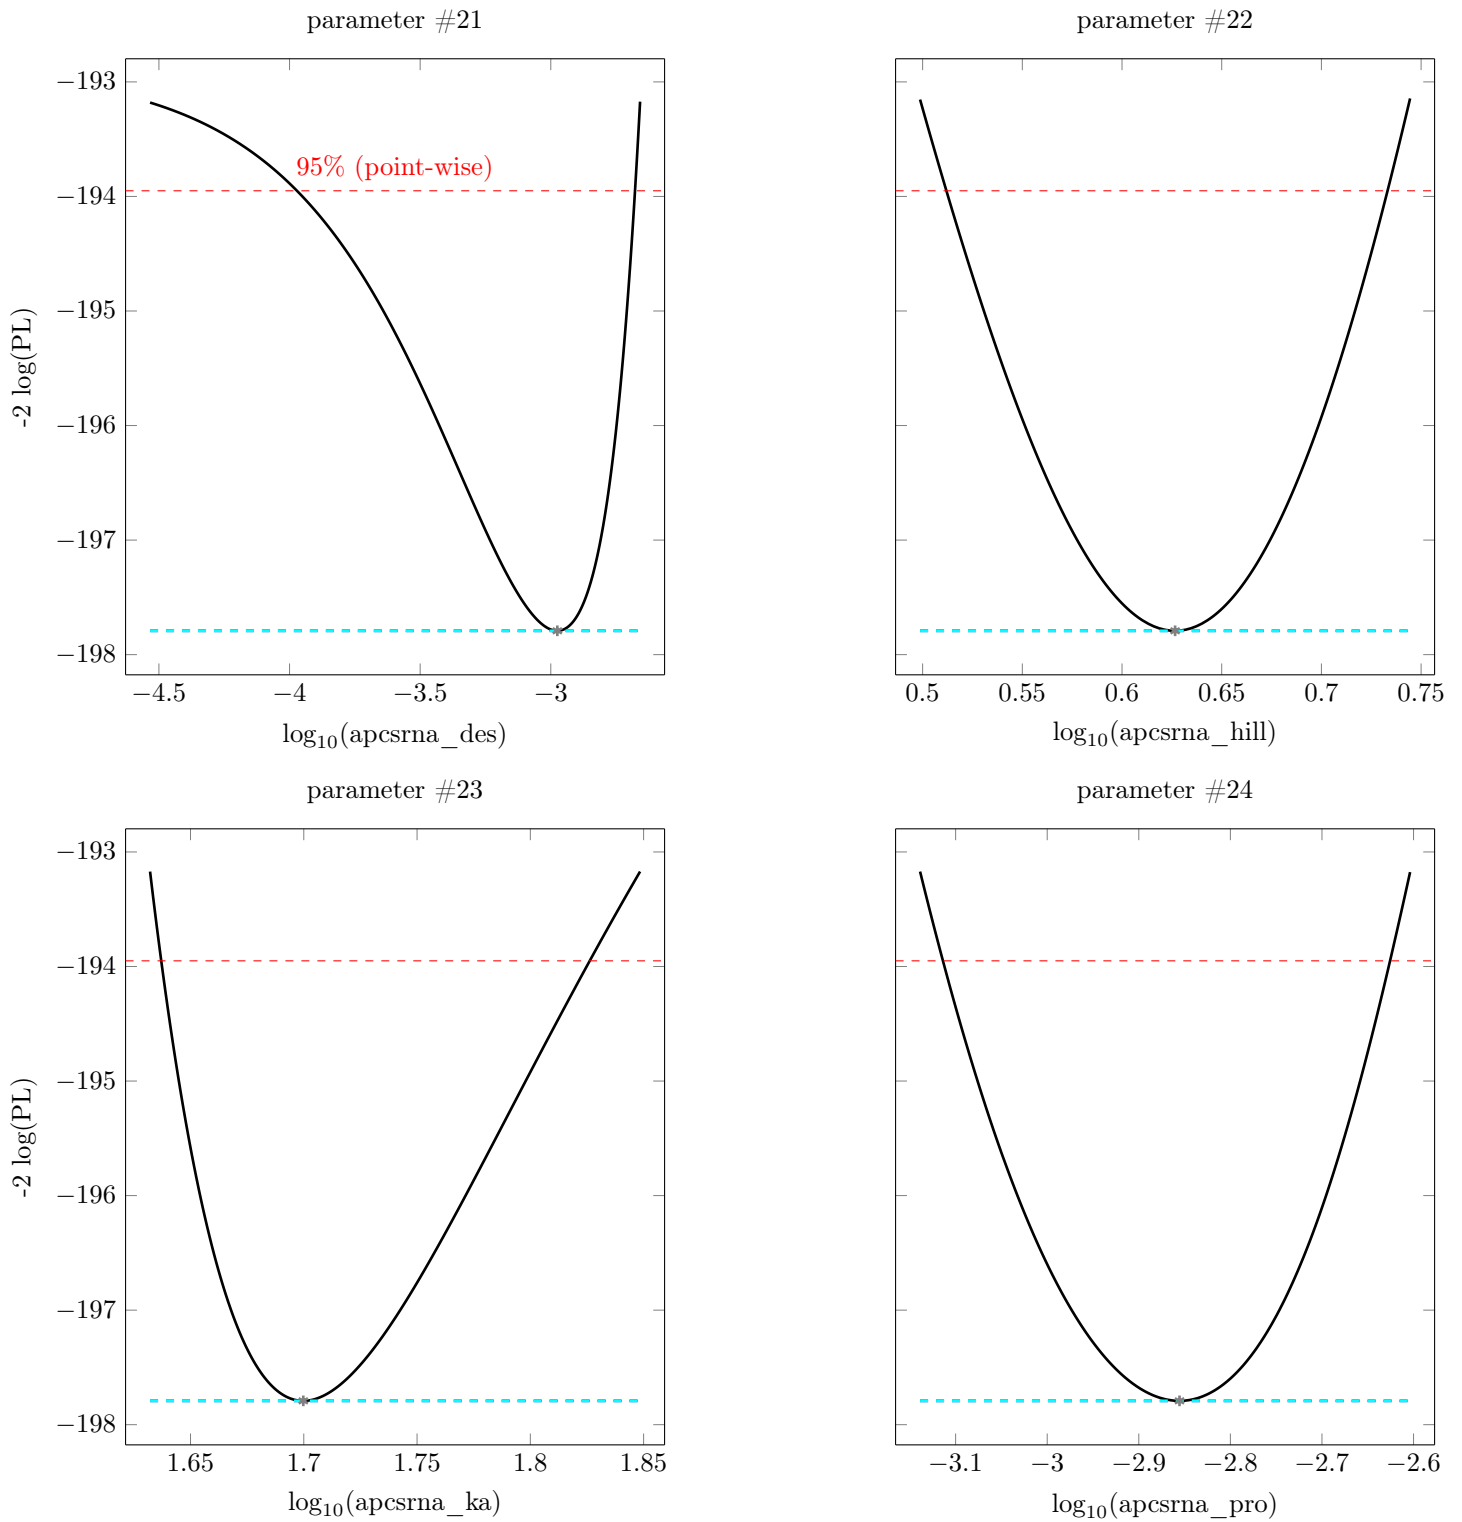

Figure S20: Overview of the profile likelihood of the APCS model parameters. The solid lines indicate the profile likelihood. The dashed lines indicate the threshold to assess confidence intervals. The asterisks indicate the optimal parameter values.

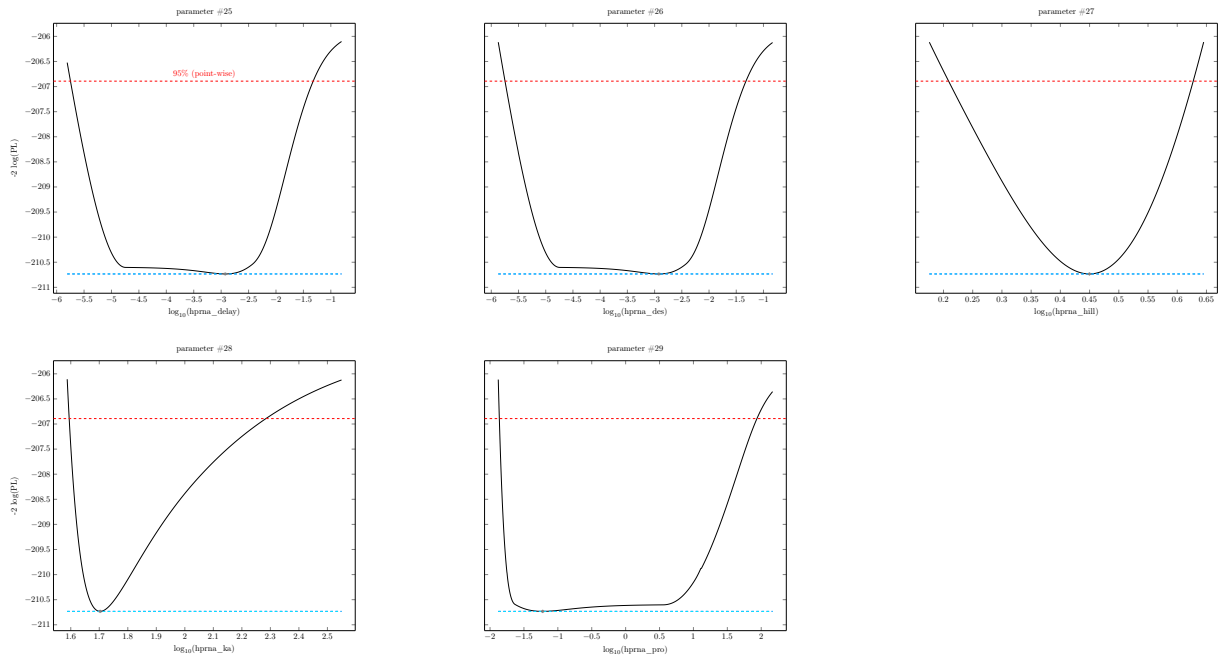

Figure S21: Overview of the profile likelihood of the HP model parameters. The solid lines indicate the profile likelihood. The dashed lines indicate the threshold to assess confidence intervals. The asterisks indicate the optimal parameter values.

Figure S22: Overview of the profile likelihood of the HPX model parameters. The solid lines indicate the profile likelihood. The dashed lines indicate the threshold to assess confidence intervals. The asterisks indicate the optimal parameter values. For this APP gene model integration fails when the hill coefficient is chosen lower than 1.

3.6 Sensitivity Analysis

If one considers the acute phase proteins to be very stable, then the protein levels will represent the integral of APP expression. In order to assess how to optimally reduce the APP response induced by IL-6, we performed a sensitivity analysis on our model. In Figure S23 we see the average local parameter sensitivity of the integrated expression of APP genes with respect to different model parameters as well

as the parameter sensitivity of SOCS3. This local parameter sensitivity is defined as (72), where y^* refers to the model output at the perturbed parameter ($\theta^* = (\theta_1, \theta_2, \dots, \theta_i \Delta, \dots, \theta_n)$), while y indicates the reference output. Analogously, θ_i^* refers to the value of the parameter of interest in the perturbed condition, while θ_i indicates the reference parameter value.

The perturbation tested here is a 50% inhibition of the parameter. Positive values indicate that APP gene expression increases with the parameter value, while negative values indicate the opposite. This means that in order to obtain reduced APP gene expression, we should aim to either inhibit those parameters that exhibit positive sensitivity, while attempting to increase those that show a negative sensitivity.

To assess the uncertainty in the model sensitivities, we made use of the parameter sets obtained using the profile likelihood. For each profile likelihood we computed sensitivities for the parameter sets at the confidence interval. These sensitivities are denoted by circles.

$$S_i = \frac{(y^* - y) / y}{(\theta_i^* - \theta_i)} \quad (72)$$

Figure S23: Parameter sensitivity of the integrated APP and SOCS3 mRNA response. Circles denote sensitivities computed using profile likelihood parameter sets corresponding at the confidence interval.

Based on sensitivity analysis, we find that additional options exist to further suppress the APP response. One such alternative would be to reduce the mRNA degradation rate of SOCS3 in order to benefit from synergistic effects between the pathway's natural inhibitor SOCS3 and the drug Ruxolitinib.

Shown in Figure S24 are the final APP dynamics. Note how the states which do not require a delay exhibit smoother dynamics and do not require preservation of the input function (the nuclear phospho-STAT3 dynamics).

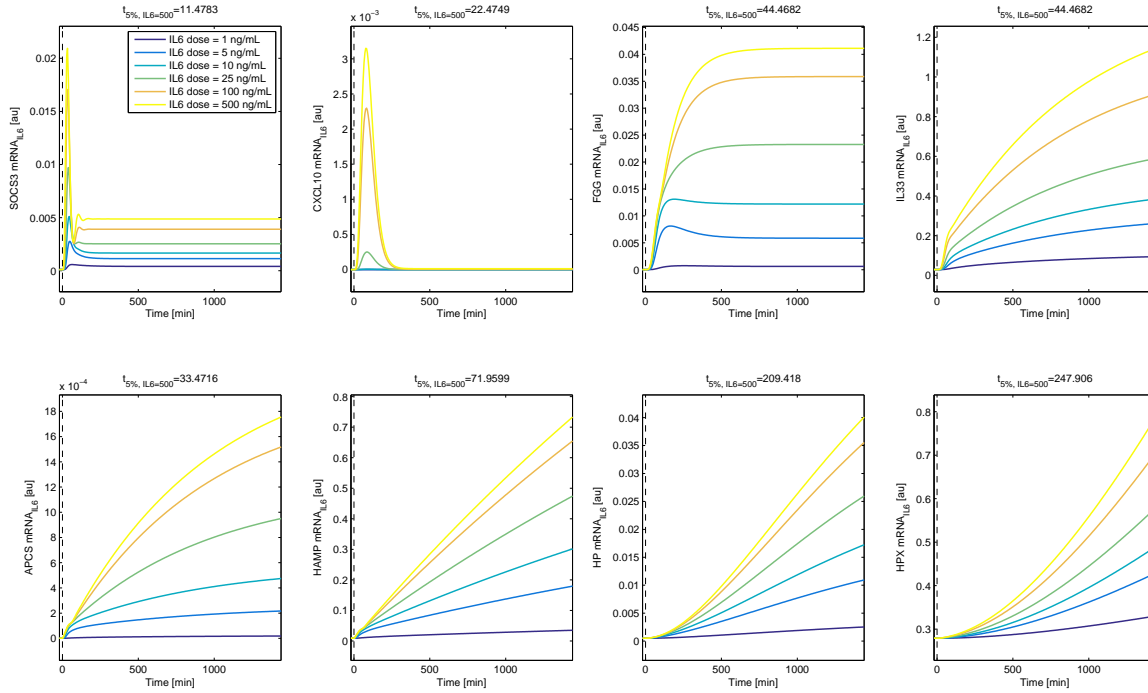

Figure S24: Dynamics of the APP genes in the dynamic model. The time indicated is the time to reach 5% of the final value at $t = 24$ hours. Most APP genes have not reached their steady state level at this point however.

3.7 Experiment Design

The developed model was used to perform experiment design, the aim of which is continuous suppression of elevated IL-6-induced APP gene expression. As an objective criterion, the integrals of the APP mRNA levels in response to 100 ng/ml IL-6 were used as a proxy for APP expression during inflammation. Based on the dose responses to Ruxolitinib, it could be concluded that the efficacy of inhibition depended monotonically on the Ruxolitinib dose. Hence, maximization of the dose of Ruxolitinib at every time point will lead to maximal inhibition. Since larger doses are expected to lead to more adverse effects, it was decided to spread the administration of Ruxolitinib over several doses. Since Ruxolitinib degradation is modelled by first order metabolism, the dose at each time point can be computed from a mono-exponential. Hence, for treatment planning, we are left with three degrees of freedom i.e. the different time points at which doses of Ruxolitinib are administered. We evaluated whether pre-treatment or treatment at the same time as IL-6 was more beneficial. In all cases, pretreatment led to longer high levels of APP expression, due to the fact that the Ruxolitinib had already partially degraded.

To determine the optimal dosage schedule, we discretized time and sampled the 3D volume representing the different dosage times. Figure S25, shows the integrated expression of the various APP genes with respect to choosing the initial dose at this time point, whilst choosing time point two and three most optimally. Hence, it shows the lowest attainable integrated APP expression when administering the first dose at this time point. Figure S26 shows the other two time points, given that the first time point is fixed at its most optimal point. Depending on which APP gene one would like to suppress, different dosage times may be optimal. Considering the sharp increase after $t=0$ for CXCL10, we decided to choose the time point for Ruxolitinib administration the same as that for IL-6. We decided to equally space the remaining two doses. However, as shown in Figure S25 and S26, when one is interested in targetting one APP gene specifically, different time points may be more optimal.

Figure S25: Dependency of integrated APP responses on initial treatment time. Shown in the graph is the lowest integrated signal attainable using triple dosing when the initial dose is given at the time point indicated on the axis.

Figure S26: Dependency of the integrated APP responses on the time intervals between the three doses. The colors are proportional to the integrated APP response for the different APP genes with respect to the dosing times indicated on the axes. Deep blue indicates a low response, while yellow indicates a high (unfavorable) response. For each plot, the first dose is chosen at its most optimal value.

As an extra control, an optimization procedure was performed to optimally divide the 882 nM of Ruxolitinib (amount used in the triple treatment) over three arbitrarily placed time points with no constraint on how the doses are divided over the time interval (with the dosing time points constrained between -200 and 1440). The only constraint used was that the total may not exceed 882 nM (total amount used in the triple treatment). The objective function was the sum of the integral of all APP genes, where each gene integral was normalized to its expression integral without Ruxolitinib administration. To avoid getting trapped in local minima, we initialized this optimization over 10000 randomly chosen initial guess parameters uniformly dispersed over the design parameter ranges. As expected, the resulting optimal time schedule to achieve maximal APP mRNA suppression with Ruxolitinib would be one single bolus. However, a single bolus is expected to lead to more adverse effects. This is why we decided to limit the maximum instantaneous dose, rather than the total dose.

4 Experiments

The following pages detail the different simulation experiments that the model was calibrated and/or validated with. Each page contains a brief description of the experiment, a plot with the model simulation, the raw data and additional information pertaining to the simulation protocol. Different simulation protocols are encoded by applying condition specific parameter and input transformations, which are listed in each of the experiment descriptions. Unlisted parameters either default to the transformation listed in the main model description 3.3, or to the raw parameter value as specified in the full table of model parameters (see 5). To get a global overview of the data involved in model parameterization, please refer to Table S9, for a description of which experiments refer to which states.

Table S9: Global overview of the used measurement data. Each line corresponds to a list of experiments that a particular model variable was observed in.

The model observables and the experimental data is shown in Figure S31.

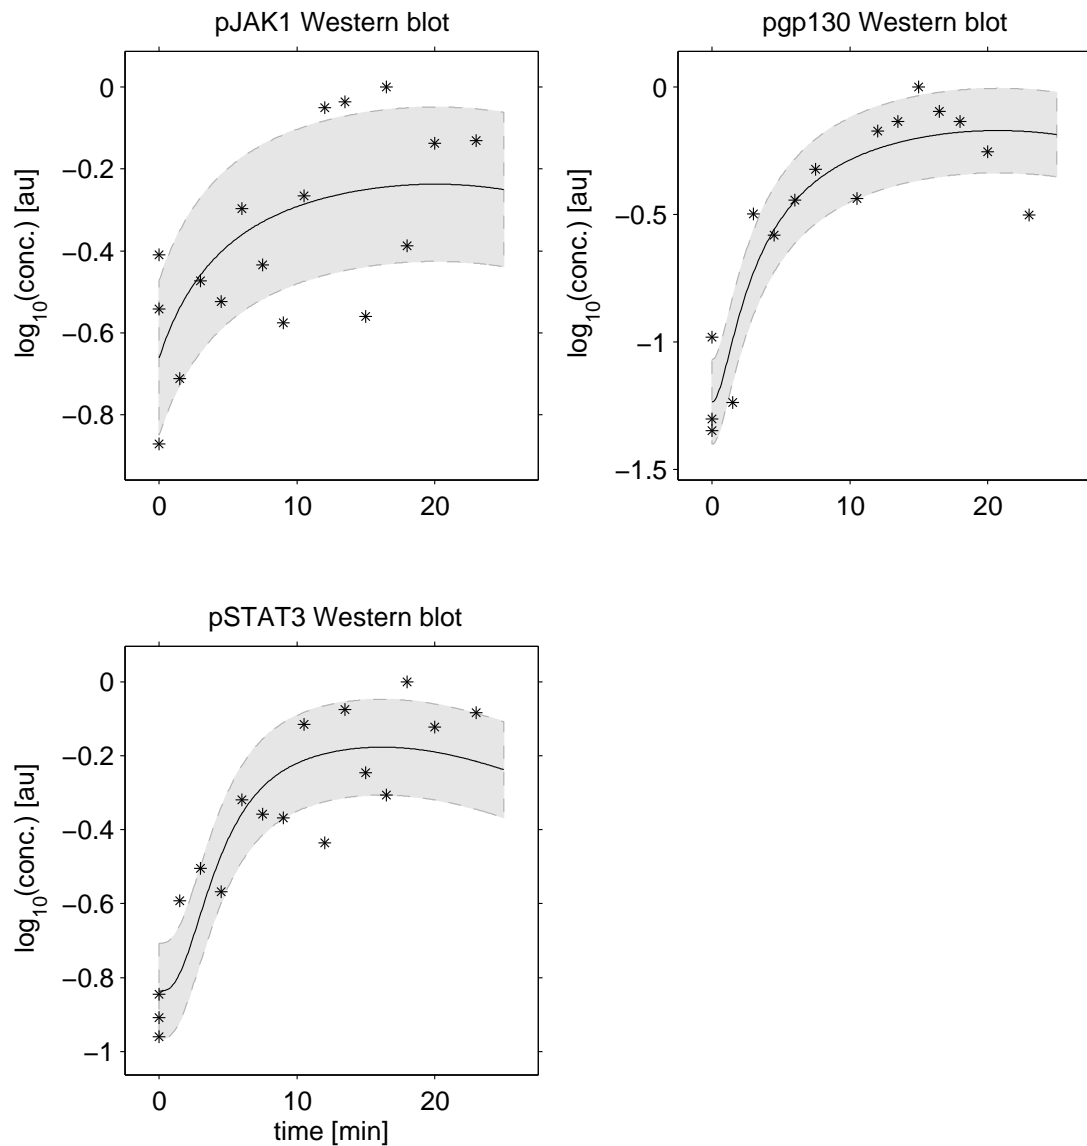

Figure S31: bohl_hep_2005_03_16_Cont40ng_23min observables and experimental data for the experiment.

4.6 Experiment: bohl hep 2005 07 26 Pulse5min

4.6.1 Comments

Experimenter: Sebastian Bohl

Date: 2005-07-26

Cells: primary mouse hepatocytes

Treatment: IL-6 40 ng/ml 5 min pulse

4.6.2 Model fit and plots

The model observables and the experimental data is shown in Figure S32. This experiment requires a custom input function which is defined in Table S12.

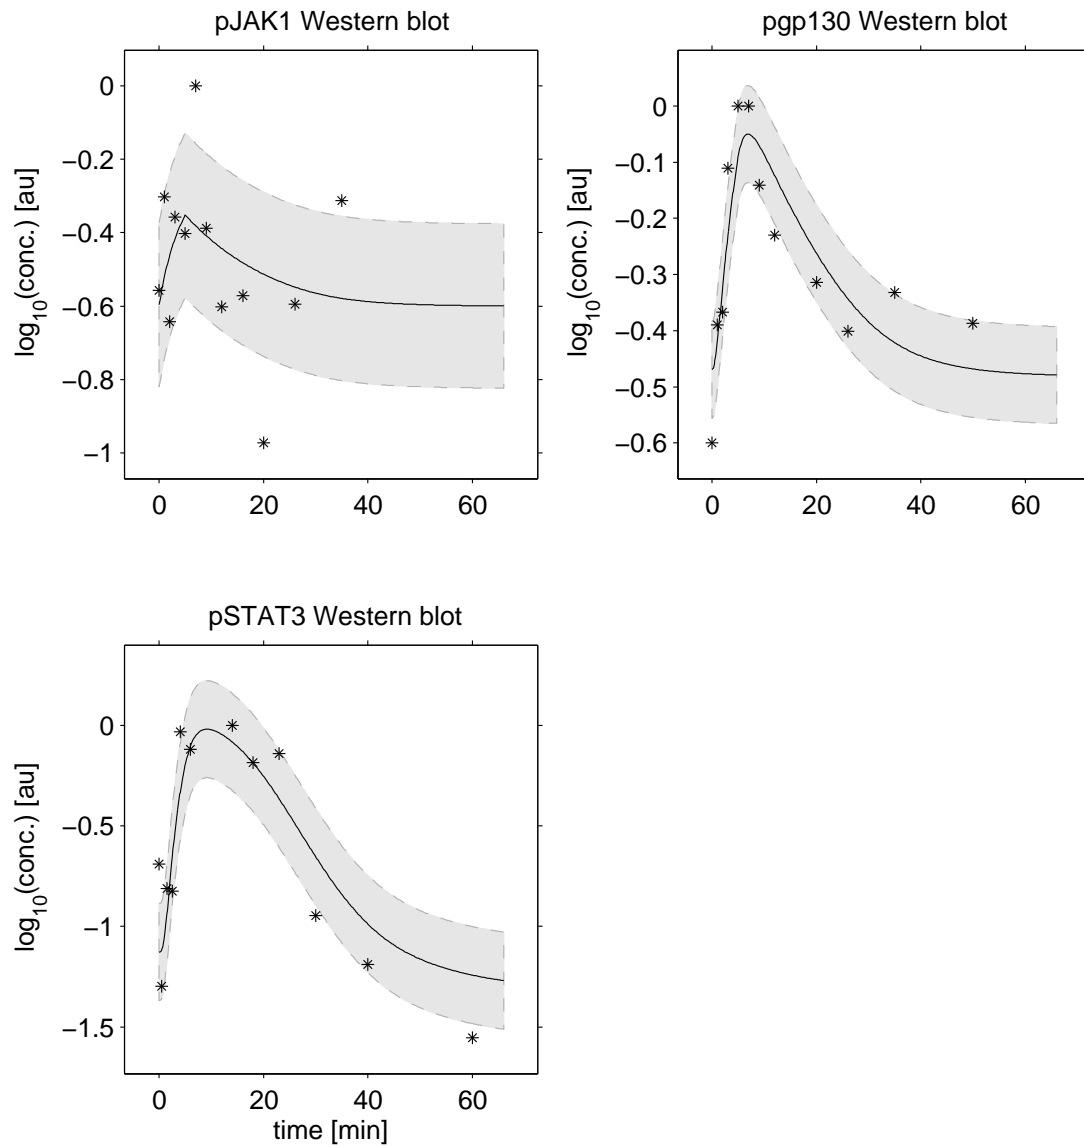

Figure S32: bohl_hep_2005_07_26_Pulse5min observables and experimental data for the experiment.

| Input | Unit | Modified equation |
|--------------|---------------|---|
| IL6 | conc. [ng/ml] | $40 - 40 \cdot \text{heaviside}(t - 5)$ |

Table S12: Inputs modified for experiment bohl_hep_2005_07_26_Pulse5min

4.7 Experiment: bohl hep 2005 11 22 DoseResponseUntil120ng

4.7.1 Comments

Experimenter: Sebastian Bohl
 Date: 2005-11-22
 Cells: primary mouse hepatocytes
 Treatment: IL-6 dose response

4.7.2 Model fit and plots

The model observables and the experimental data is shown in Figure S33. The necessary parameter transformation is listed in Table S13.

Figure S33: bohl_hep_2005_11_22_DoseResponseUntil120ng observables and experimental data for the experiment.

4.7.3 Condition dependent parameter changes

The following model parameters were changed to simulate these experimental conditions:

| Parameter | Condition values | | | | | | |
|-----------|------------------|----|-----|----|----|---|----|
| input_il6 | 0 | 10 | 120 | 20 | 40 | 5 | 80 |

Table S13: Model parameters modified for experiment bohl hep 2005 11 22 DoseResponseUntil120ng. Different columns indicate different conditions.

4.8 Experiment: bohl hep 2009 10 14 qRTPCR

4.8.1 Comments

Experimenter: Sebastian Bohl
Date: 2009-10-14
Cells: primary mouse hepatocytes
Treatment: IL-6 40 ng/ml = 1 nmol/l
values normalized by HPRT
biological replicates

4.8.2 Model fit and plots

The model observables and the experimental data is shown in Figure S34.

Figure S34: bohl_hep_2009_10_14_qRTPCR observables and experimental data for the experiment.

4.9 Experiment: bohl mlc per cell log

4.9.1 Comments

Experimenter: Sebastian Bohl

Date: 2007-09-05 (summary)

Cells: primary mouse hepatocytes

Treatment: IL-6 40 to 625 ng/ml constant

4.9.2 Model fit and plots

The model observables and the experimental data is shown in Figure S35.

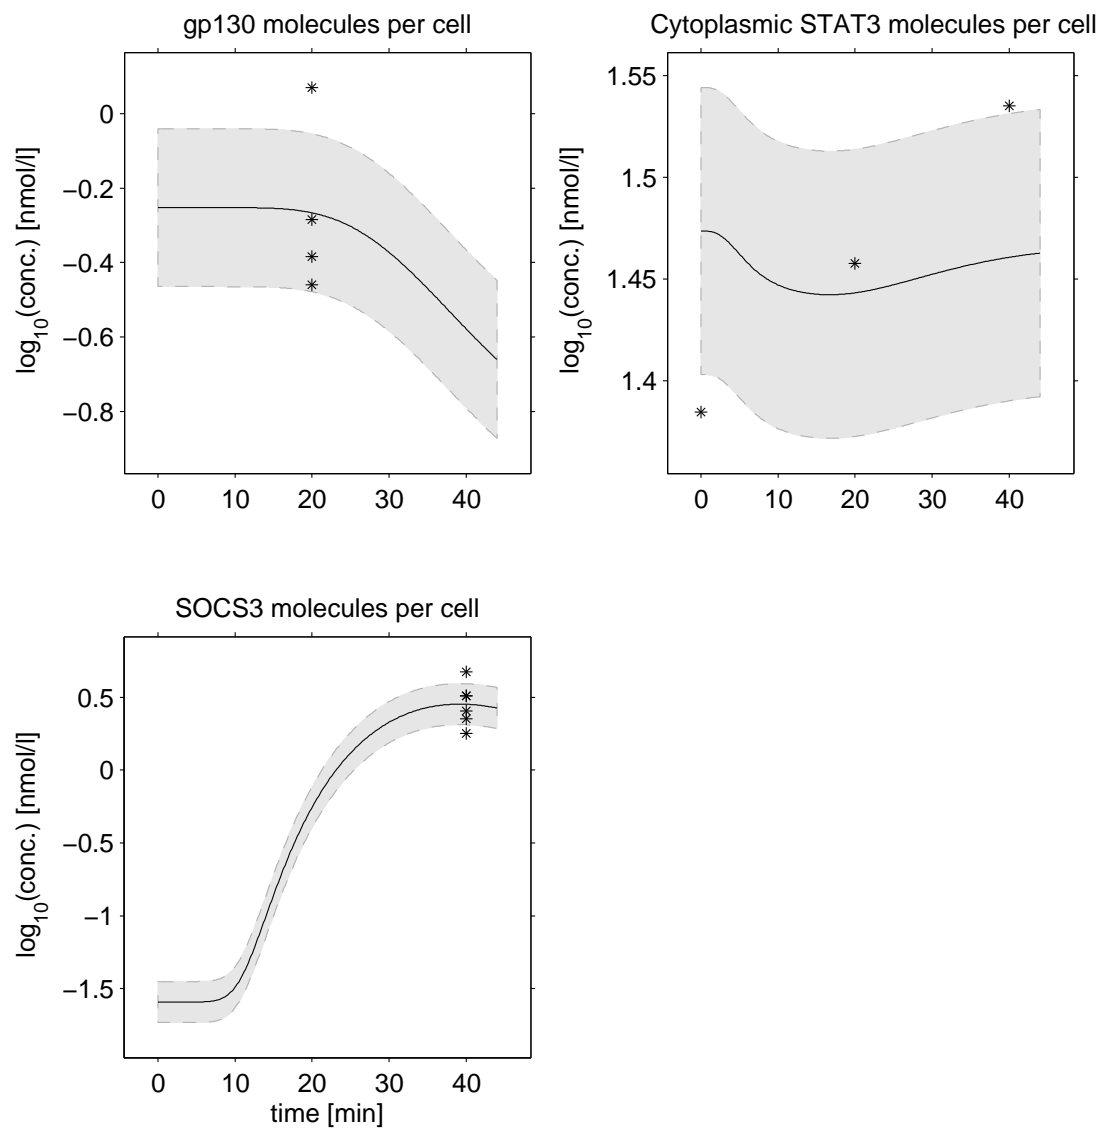

Figure S35: bohl_mlc_per_cell_log observables and experimental data for the experiment.

4.10 Experiment: bohl hep 2007 07 10 ActD

4.10.1 Comments

Experimenter: Sebastian Bohl

Date: 2007-07-10

Cells: primary mouse hepatocytes

Treatment: IL-6 80 ng/ml constant + Act-D treatment

4.10.2 Model fit and plots

The model observables and the experimental data is shown in Figure S36. The 2 necessary parameter transformations are listed in Table S14. Note that transformations with only one entry are the same for all experimental conditions corresponding to this experiment.

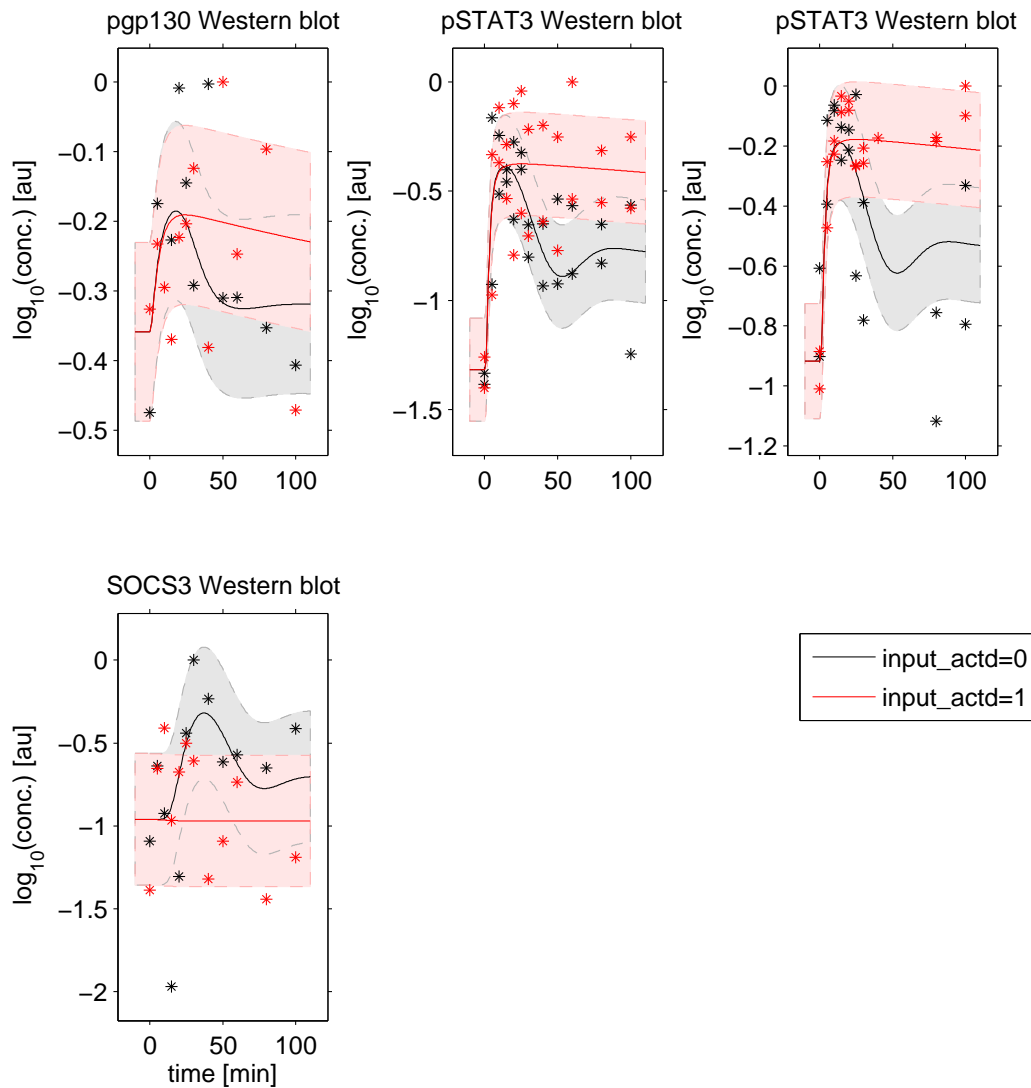

Figure S36: bohl_hep_2007_07_10_ActD observables and experimental data for the experiment.

4.10.3 Condition dependent parameter changes

The following model parameters were changed to simulate these experimental conditions:

| Parameter | Condition values |
|------------|------------------|
| input_il6 | 80 |
| input_actd | 0 1 |

Table S14: Model parameters modified for experiment bohl hep 2007 07 10 ActD. Different columns indicate different conditions.

4.11 Experiment: bohl hep 2006 06 07 ActD

4.11.1 Comments

Experimenter: Sebastian Bohl

Date: 2006-06-07

Cells: primary mouse hepatocytes

Treatment: IL-6 80 ng/ml constant + 3 different Act-D treatment

4.11.2 Model fit and plots

The model observables and the experimental data is shown in Figure S37. This experiment requires a custom input function which is defined in Table S15. The 3 necessary parameter transformations are listed in Table S16. Note that transformations with only one entry are the same for all experimental conditions corresponding to this experiment.

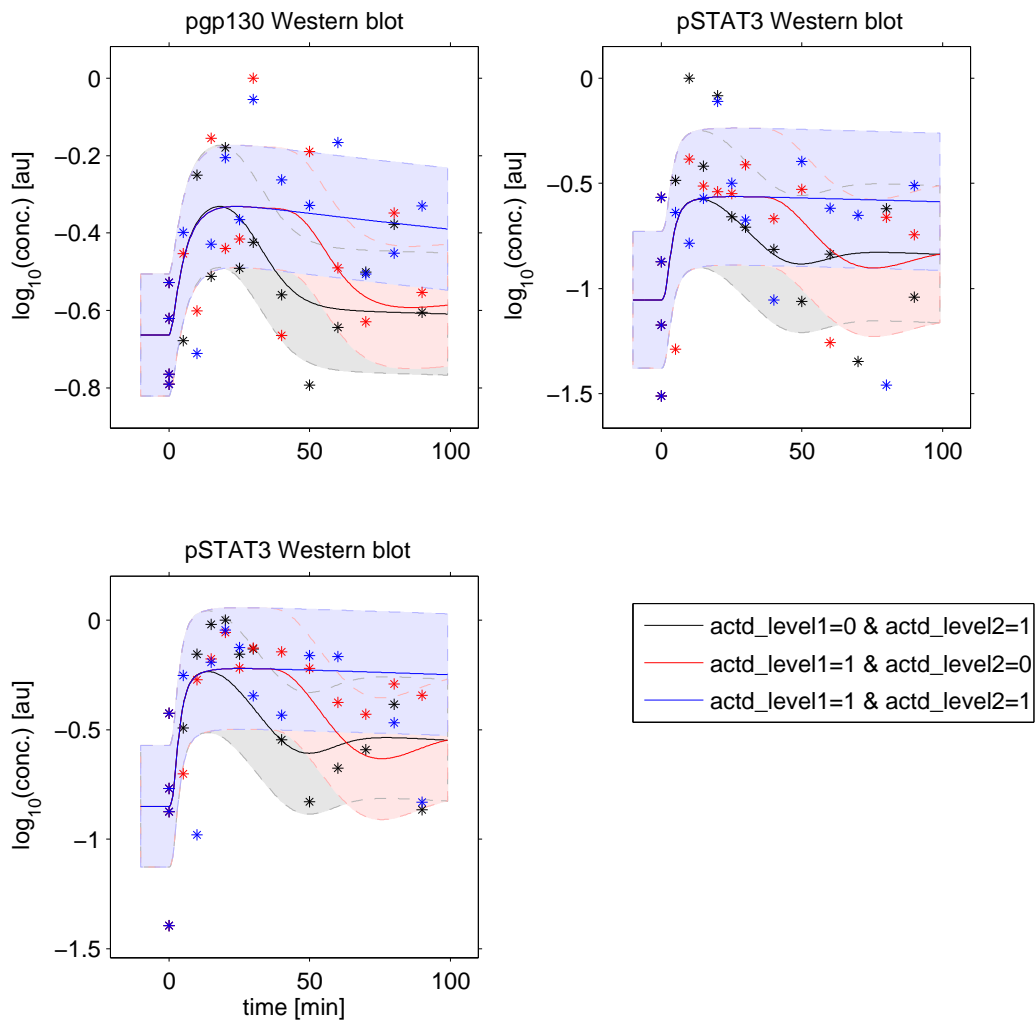

Figure S37: bohl_hep_2006_06_07_ActD observables and experimental data for the experiment.

| Input | Unit | Modified equation |
|-------|------------------|--|
| ActD | boolean [on/off] | $\text{actd_level1} \cdot \text{heaviside}(t) - \text{heaviside}(t - 30) \cdot (\text{actd_level1} - \text{actd_level2})$ |

Table S15: Inputs modified for experiment bohl_hep_2006_06_07_ActD

4.11.3 Condition dependent parameter changes

The following model parameters were changed to simulate these experimental conditions:

| Parameter | Condition values | | |
|-------------|------------------|---|---|
| input_il6 | 80 | | |
| actd_level1 | 0 | 1 | 1 |
| actd_level2 | 1 | 0 | 1 |

Table S16: Model parameters modified for experiment bohl hep 2006 06 07 ActD. Different columns indicate different conditions.

4.12 Experiment: bohl hep 2006 02 09 FourPulses ReceptorNucleus

4.12.1 Comments

Experimenter: Sebastian Bohl
 Date: 2006-02-09
 Cells: primary mouse hepatocytes
 Treatment: IL-6 80 ng/ml 6-12-24-90 min pulses

4.12.2 Model fit and plots

The model observables and the experimental data is shown in Figure S38. This experiment requires a custom input function which is defined in Table S17. The necessary parameter transformation is listed in Table S18.

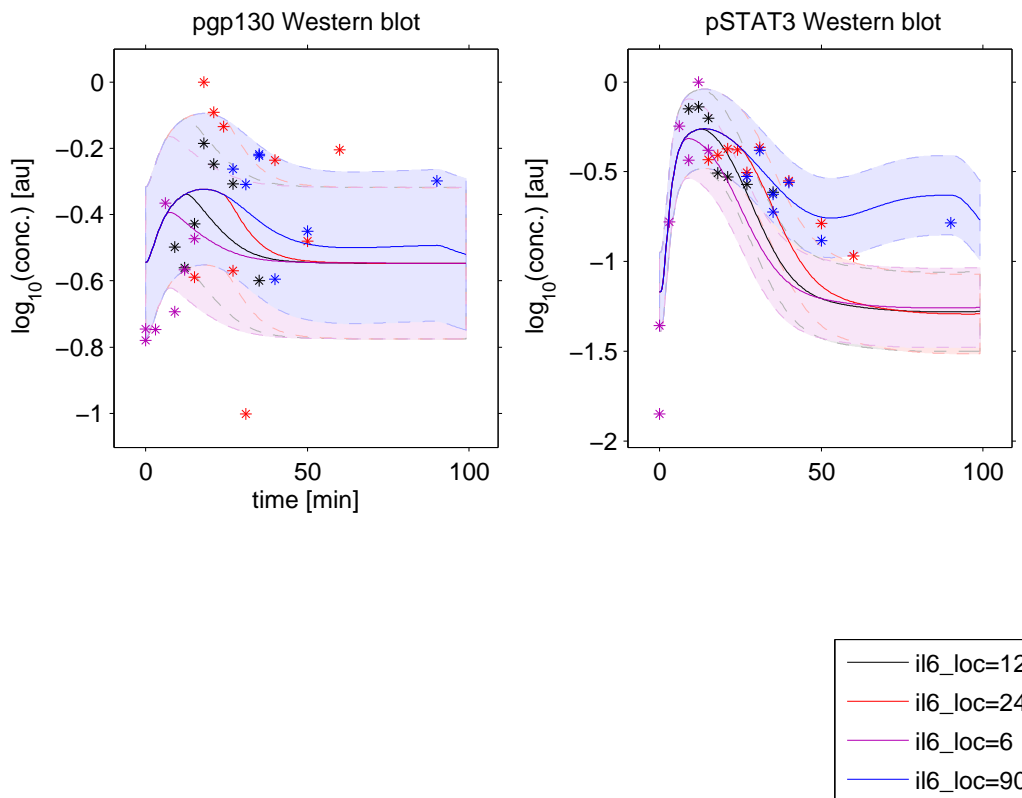

Figure S38: bohl_hep_2006_02_09_FourPulses_ReceptorNucleus observables and experimental data for the experiment.

| Input | Unit | Modified equation |
|-------|---------------|---|
| IL6 | conc. [ng/ml] | $80 - 80 \cdot \text{heaviside}(t - \text{il6_loc})$ |

Table S17: Inputs modified for experiment bohl_hep_2006_02_09_FourPulses_ReceptorNucleus

4.12.3 Condition dependent parameter changes

The following model parameters were changed to simulate these experimental conditions:

| Parameter | Condition values | | | |
|-----------|------------------|----|---|----|
| il6_loc | 12 | 24 | 6 | 90 |

Table S18: Model parameters modified for experiment bohl hep 2006 02 09 FourPulses ReceptorNucleus. Different columns indicate different conditions.

4.13 Experiment: bohl hep 2006 04 20 ThreePulses ThreeDoses

4.13.1 Comments

Experimenter: Sebastian Bohl

Date: 2006-04-20

Cells: primary mouse hepatocytes

Treatment: IL-6 30-60-120 ng/ml 10-20-40 min pulses

4.13.2 Model fit and plots

The model observables and the experimental data is shown in Figure S39. This experiment requires a custom input function which is defined in Table S19. The 2 necessary parameter transformations are listed in Table S20. Note that transformations with only one entry are the same for all experimental conditions corresponding to this experiment.

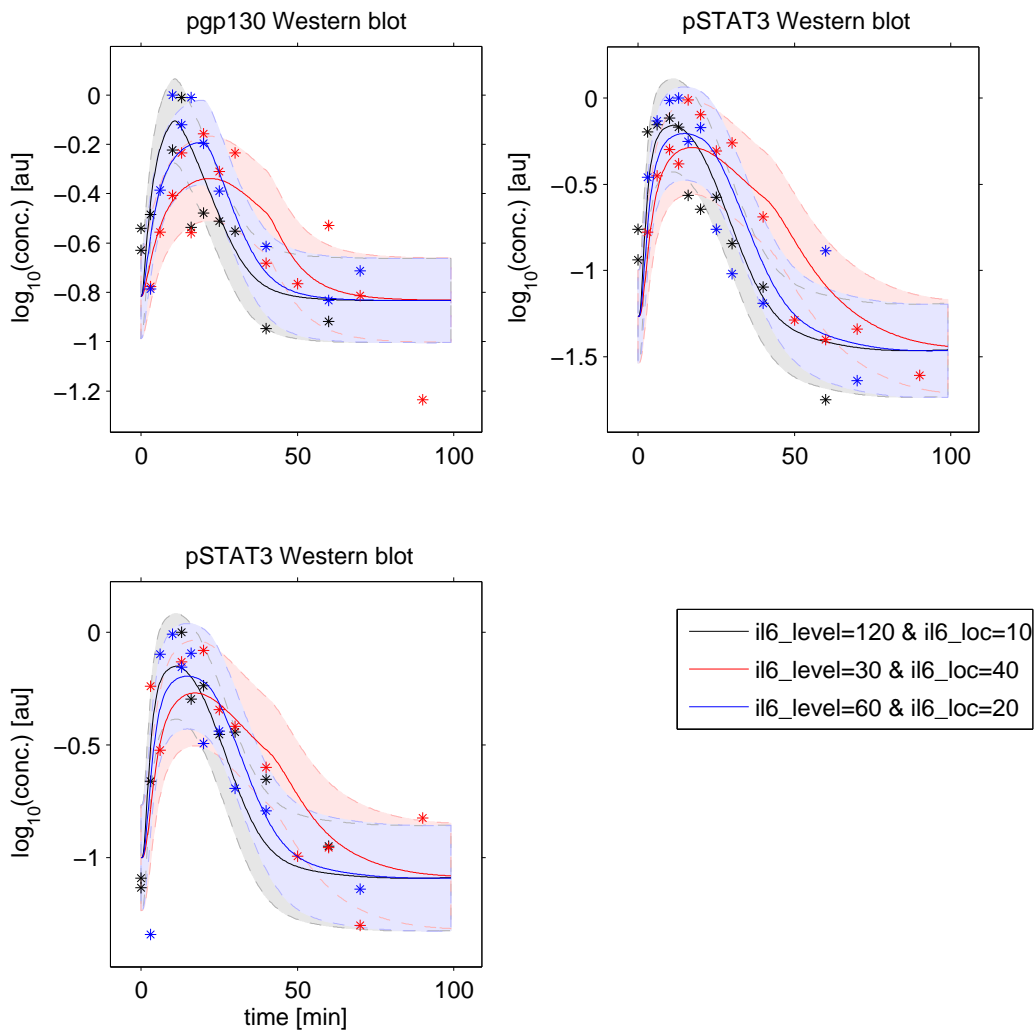

Figure S39: bohl_hep_2006_04_20_ThreePulses_ThreeDoses observables and experimental data for the experiment.

| Input | Unit | Modified equation |
|-------|---------------|--|
| IL6 | conc. [ng/ml] | $il6_level - il6_level \cdot \text{heaviside}(t - il6_loc)$ |

Table S19: Inputs modified for experiment `bohl_hep_2006_04_20_ThreePulses_ThreeDoses`

4.13.3 Condition dependent parameter changes

The following model parameters were changed to simulate these experimental conditions:

| Parameter | Condition values | | |
|------------------------|------------------|----|----|
| <code>il6_level</code> | 120 | 30 | 60 |
| <code>il6_loc</code> | 10 | 40 | 20 |

Table S20: Model parameters modified for experiment `bohl_hep_2006_04_20_ThreePulses_ThreeDoses`. Different columns indicate different conditions.

4.14 Experiment: bohl hep 2006 05 16 ThreeDoses

4.14.1 Comments

Experimenter: Sebastian Bohl
 Date: 2006-05-16
 Cells: primary mouse hepatocytes
 Treatment: IL-6 20-40-80 ng/ml 20 min pulses

4.14.2 Model fit and plots

The model observables and the experimental data is shown in Figure S40. This experiment requires a custom input function which is defined in Table S21. The necessary parameter transformation is listed in Table S22.

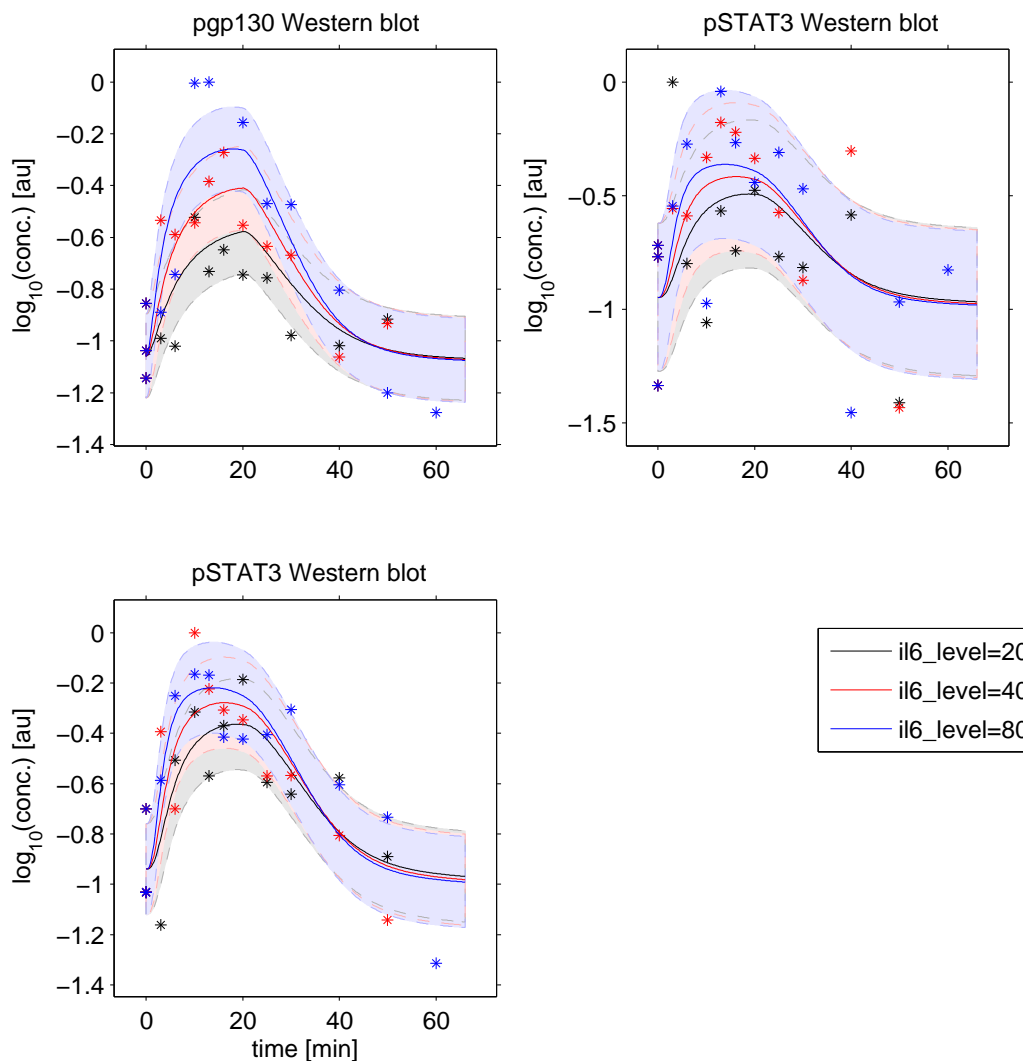

Figure S40: bohl_hep_2006_05_16_ThreeDoses observables and experimental data for the experiment.

| Input | Unit | Modified equation |
|-------|---------------|--|
| IL6 | conc. [ng/ml] | $il6_level - il6_level \cdot \text{heaviside}(t - 20)$ |

Table S21: Inputs modified for experiment bohl_hep_2006_05_16_ThreeDoses

4.14.3 Condition dependent parameter changes

The following model parameters were changed to simulate these experimental conditions:

| Parameter | Condition values | | |
|-----------|------------------|----|----|
| il6_level | 20 | 40 | 80 |

Table S22: Model parameters modified for experiment bohl hep 2006 05 16 ThreeDoses. Different columns indicate different conditions.

4.15 Experiment: bohl hep 2006 11 15 FourPulses 120min

4.15.1 Comments

Experimenter: Sebastian Bohl
 Date: 2006-11-15
 Cells: primary mouse hepatocytes
 Treatment: IL-6 40 ng/ml 6-12-24-120 min pulses

4.15.2 Model fit and plots

The model observables and the experimental data is shown in Figure S41. This experiment requires a custom input function which is defined in Table S23. The necessary parameter transformation is listed in Table S24.

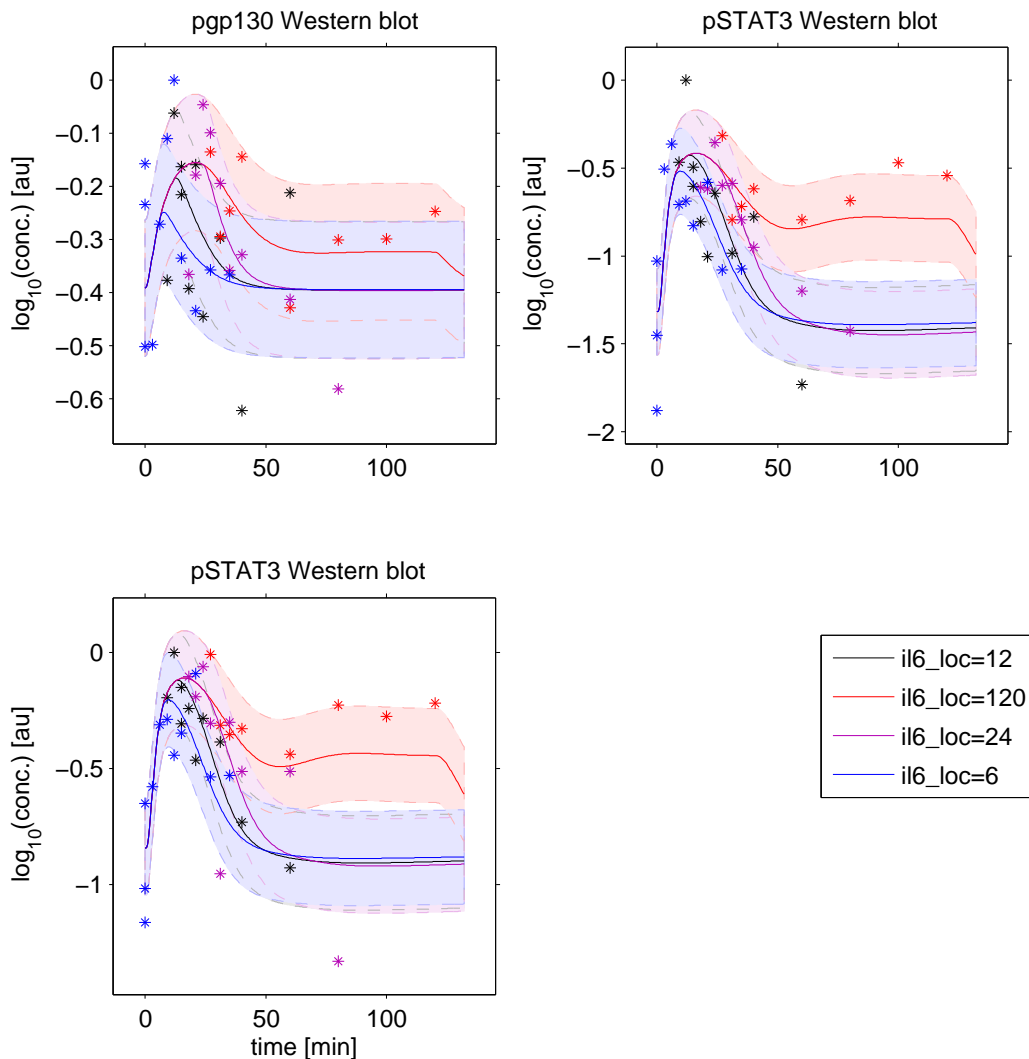

Figure S41: bohl_hep_2006_11_15_FourPulses_120min observables and experimental data for the experiment.

| Input | Unit | Modified equation |
|-------|---------------|---|
| IL6 | conc. [ng/ml] | $40 - 40 \cdot \text{heaviside}(t - \text{il6_loc})$ |

Table S23: Inputs modified for experiment bohl_hep_2006_11_15_FourPulses_120min

4.15.3 Condition dependent parameter changes

The following model parameters were changed to simulate these experimental conditions:

| Parameter | Condition values | | | |
|-----------|------------------|-----|----|---|
| il6_loc | 12 | 120 | 24 | 6 |

Table S24: Model parameters modified for experiment bohl hep 2006 11 15 FourPulses 120min. Different columns indicate different conditions.

4.16 Experiment: bohl hep 2007 04 04 DoseResponse 3TP

4.16.1 Comments

Experimenter: Sebastian Bohl
Date: 2007-04-04
Cells: primary mouse hepatocytes
Treatment: IL-6 dose response

4.16.2 Model fit and plots

The model observables and the experimental data is shown in Figure S42. The necessary parameter transformation is listed in Table S25.

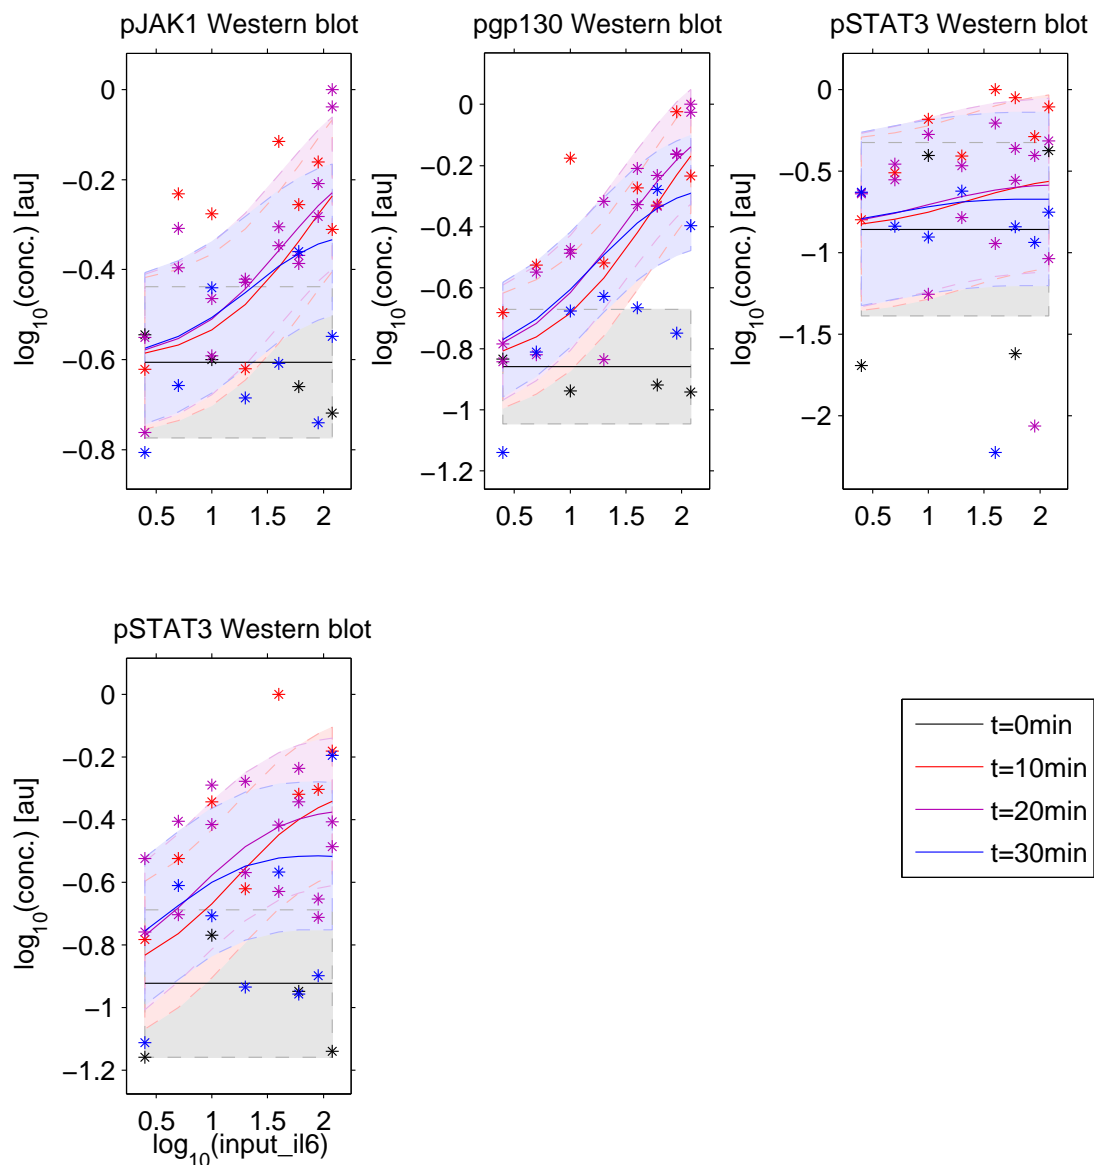

Figure S42: bohl_hep_2007_04_04_DoseResponse_3TP observables and experimental data for the experiment.

4.16.3 Condition dependent parameter changes

The following model parameters were changed to simulate these experimental conditions:

| Parameter | Condition values | | | | | | | |
|-----------|------------------|-----|-----|----|----|---|----|----|
| input.il6 | 10 | 120 | 2.5 | 20 | 40 | 5 | 60 | 90 |

Table S25: Model parameters modified for experiment bohl hep 2007 04 04 DoseResponse 3TP. Different columns indicate different conditions.

4.17 Experiment: bohl hep 2007 07 17 DRTC

4.17.1 Comments

Experimenter: Sebastian Bohl

Date: 2007-07-17

Cells: primary mouse hepatocytes

Treatment: IL-6 5-10-20-40-80ng/ml constant

4.17.2 Model fit and plots

The model observables and the experimental data is shown in Figure S43. The necessary parameter transformation is listed in Table S26.

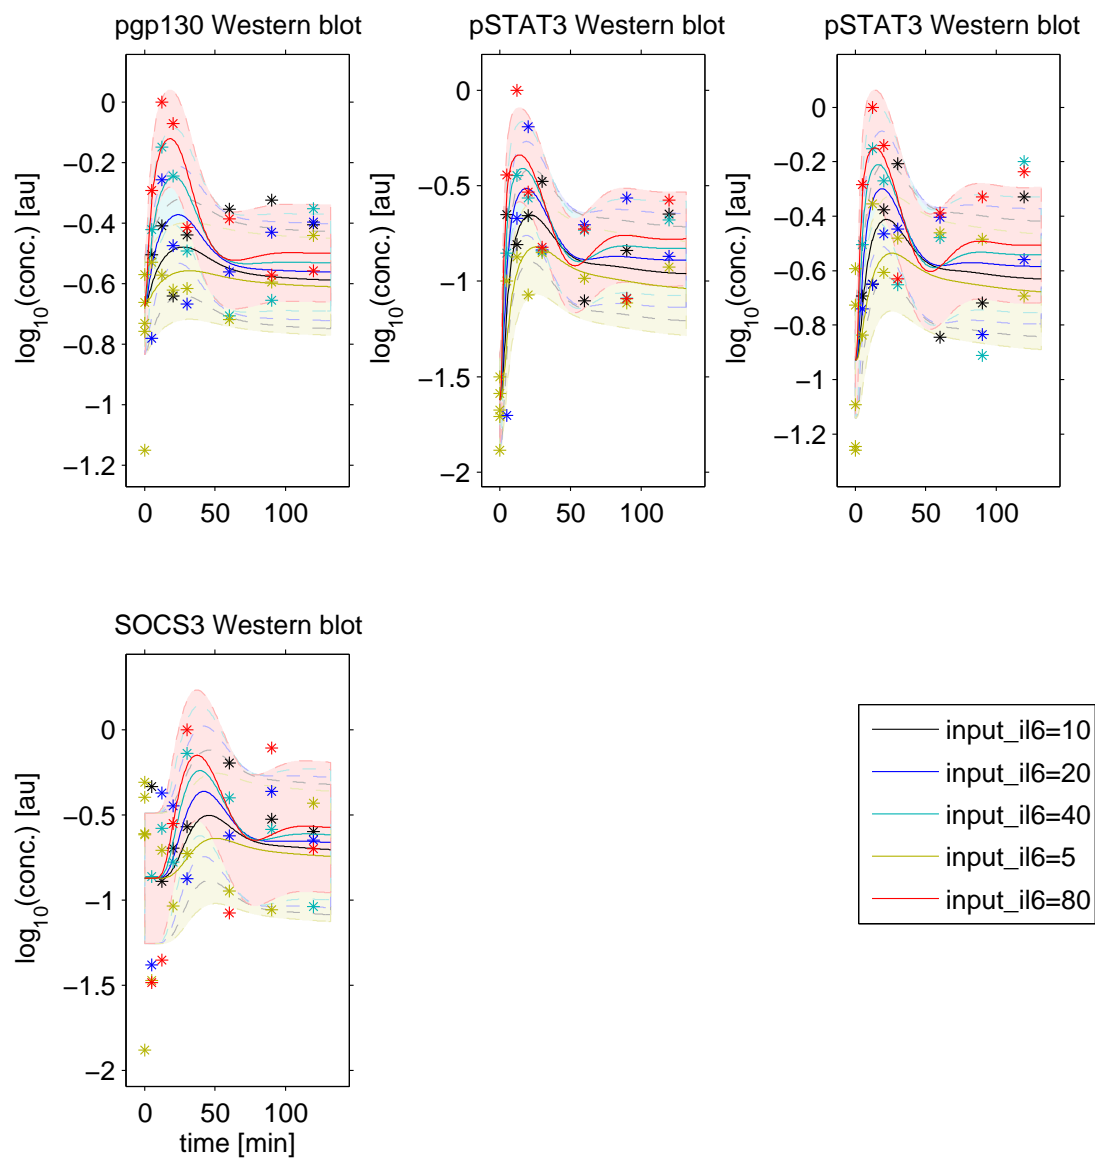

Figure S43: bohl_hep_2007_07_17_DRTC observables and experimental data for the experiment.

4.17.3 Condition dependent parameter changes

The following model parameters were changed to simulate these experimental conditions:

| Parameter | Condition values | | | | |
|-----------|------------------|----|----|---|----|
| input.il6 | 10 | 20 | 40 | 5 | 80 |

Table S26: Model parameters modified for experiment bohl hep 2007 07 17 DRTC. Different columns indicate different conditions.

4.18 Experiment: bohl hep 2009 06 23 DRTC

4.18.1 Comments

Experimenter: Sebastian Bohl

Date: 2009-06-23

Cells: primary mouse hepatocytes

Treatment: IL-6 0.25-0.5-1-2 ng/ml constant

4.18.2 Model fit and plots

The model observables and the experimental data is shown in Figure S44. The necessary parameter transformation is listed in Table S27.

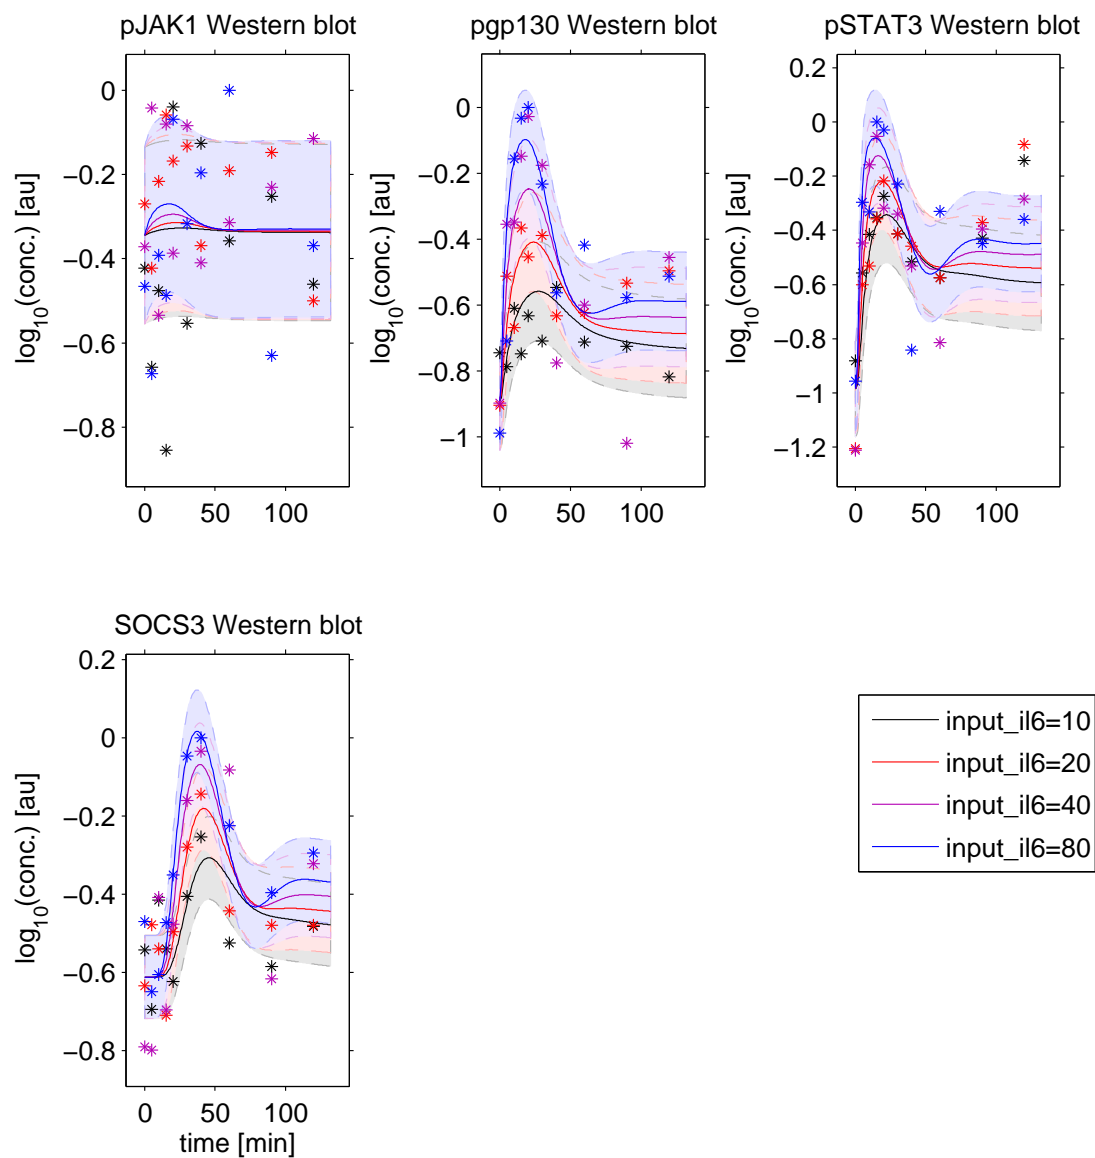

Figure S44: bohl_hep_2009_06_23_DRTC observables and experimental data for the experiment.

4.18.3 Condition dependent parameter changes

The following model parameters were changed to simulate these experimental conditions:

| Parameter | Condition values | | | |
|-----------|------------------|----|----|----|
| input_il6 | 10 | 20 | 40 | 80 |

Table S27: Model parameters modified for experiment bohl hep 2009 06 23 DRTC. Different columns indicate different conditions.

4.19 Experiment: bohl hep 2009 07 07 DRTC

4.19.1 Comments

Experimenter: Sebastian Bohl

Date: 2009-07-07

Cells: primary mouse hepatocytes

Treatment: IL-6 0.25-0.5-1-2 ng/ml constant

4.19.2 Model fit and plots

The model observables and the experimental data is shown in Figure S45. The necessary parameter transformation is listed in Table S28.

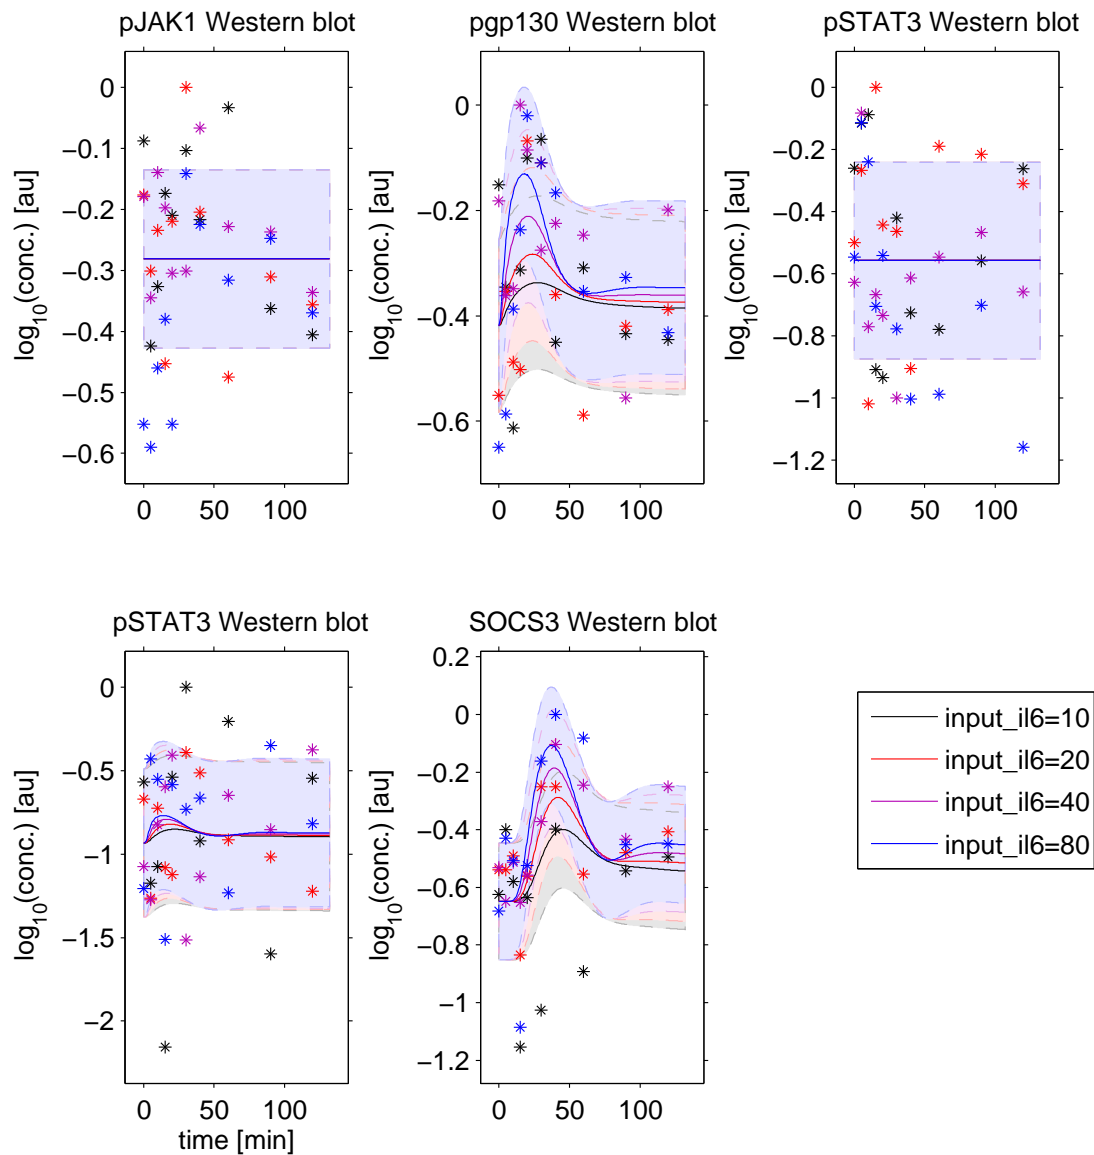

Figure S45: bohl_hep_2009_07_07_DRTC observables and experimental data for the experiment.

4.19.3 Condition dependent parameter changes

The model observables and the experimental data is shown in Figure S54. The 2 necessary parameter transformations are listed in Table S37. Note that transformations with only one entry are the same for all experimental conditions corresponding to this experiment.

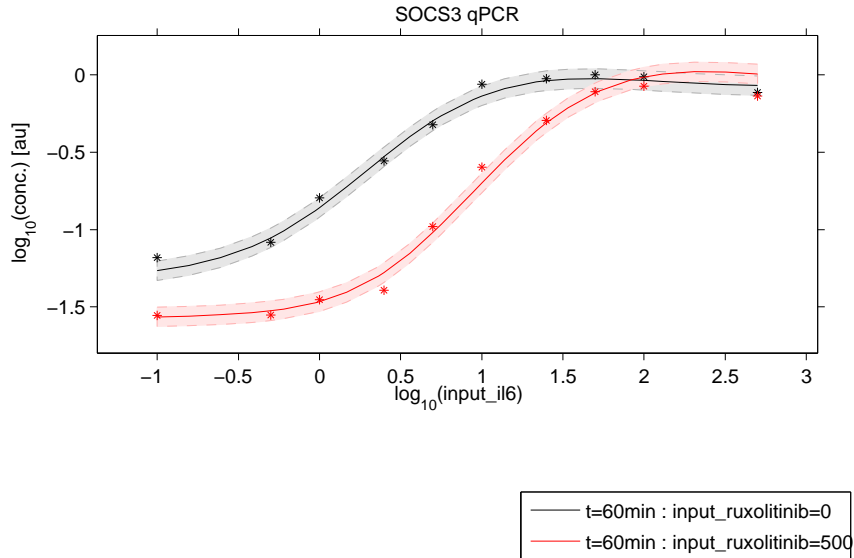

Figure S54: braun_app_hep_2013_10_14_qPCR_140224_IL6DR_Inh_1h_Socs3 observables and experimental data for the experiment.

4.28.2 Condition dependent parameter changes

The following model parameters were changed to simulate these experimental conditions:

| Parameter | Condition values | | | | | | | | | | | | | | | | | | | |
|-------------------|------------------|-----|-----|-----|---|-----|----|-----|-----|-----|-----|-----|----|-----|---|-----|----|-----|-----|-----|
| input_il6 | 0.1 | 0.1 | 0.5 | 0.5 | 1 | 1 | 10 | 10 | 100 | 100 | 2.5 | 2.5 | 25 | 25 | 5 | 5 | 50 | 50 | 500 | 500 |
| input_ruxolitinib | 0 | 500 | 0 | 500 | 0 | 500 | 0 | 500 | 0 | 500 | 0 | 500 | 0 | 500 | 0 | 500 | 0 | 500 | 0 | 500 |

Table S37: Model parameters modified for experiment braun app hep 2013 10 14 qPCR 140224 IL6DR Inh 1h Socs3. Different columns indicate different conditions.

4.29 Experiment: braun app hep 2014 04 22 qPCR 140526 IL6DR Rux 6h SOCS3

4.29.1 Model fit and plots

The model observables and the experimental data is shown in Figure S55. The 2 necessary parameter transformations are listed in Table S38. Note that transformations with only one entry are the same for all experimental conditions corresponding to this experiment.

Figure S55: braun_app_hep_2014_04_22_qPCR_140526_IL6DR_Rux_6h_SOCS3 observables and experimental data for the experiment.

4.29.2 Condition dependent parameter changes

The following model parameters were changed to simulate these experimental conditions:

| Parameter | Condition values | | | | | | | | | | | | | | | | | | | |
|-------------------|------------------|-----|-----|-----|---|-----|----|-----|-----|-----|-----|-----|----|-----|---|-----|----|-----|-----|-----|
| input_il6 | 0.1 | 0.1 | 0.5 | 0.5 | 1 | 1 | 10 | 10 | 100 | 100 | 2.5 | 2.5 | 25 | 25 | 5 | 5 | 50 | 50 | 500 | 500 |
| input_ruxolitinib | 0 | 500 | 0 | 500 | 0 | 500 | 0 | 500 | 0 | 500 | 0 | 500 | 0 | 500 | 0 | 500 | 0 | 500 | 0 | 500 |

Table S38: Model parameters modified for experiment braun app hep 2014 04 22 qPCR 140526 IL6DR Rux 6h SOCS3. Different columns indicate different conditions.

4.30 Experiment: braun app hep 2014 05 19 qPCR 140526 IL6DR Rux 6h SOCS3

4.30.1 Model fit and plots

The model observables and the experimental data is shown in Figure S56. The 2 necessary parameter transformations are listed in Table S39. Note that transformations with only one entry are the same for all experimental conditions corresponding to this experiment.

Figure S56: braun_app_hep_2014_05_19_qPCR_140526_IL6DR_Rux_6h_SOCS3 observables and experimental data for the experiment.

4.30.2 Condition dependent parameter changes

The following model parameters were changed to simulate these experimental conditions:

| Parameter | Condition values | | | | | | | | | | | | | | | | | | | |
|-------------------|------------------|-----|-----|-----|---|-----|----|-----|-----|-----|-----|-----|----|-----|---|-----|----|-----|-----|-----|
| input_il6 | 0.1 | 0.1 | 0.5 | 0.5 | 1 | 1 | 10 | 10 | 100 | 100 | 2.5 | 2.5 | 25 | 25 | 5 | 5 | 50 | 50 | 500 | 500 |
| input_ruxolitinib | 0 | 500 | 0 | 500 | 0 | 500 | 0 | 500 | 0 | 500 | 0 | 500 | 0 | 500 | 0 | 500 | 0 | 500 | 0 | 500 |

Table S39: Model parameters modified for experiment braun app hep 2014 05 19 qPCR 140526 IL6DR Rux 6h SOCS3. Different columns indicate different conditions.

4.31 Experiment: braun app hep 2014 04 22 qPCR 140604 IL6DR Rux 24h SOCS3

4.31.1 Model fit and plots

The model observables and the experimental data is shown in Figure S57. The 2 necessary parameter transformations are listed in Table S40. Note that transformations with only one entry are the same for all experimental conditions corresponding to this experiment.

Figure S57: braun_app_hep_2014_04_22_qPCR_140604_IL6DR_Rux_24h_SOCS3 observables and experimental data for the experiment.

4.31.2 Condition dependent parameter changes

The following model parameters were changed to simulate these experimental conditions:

| Parameter | Condition values | | | | | | | | | | | | | | | | | | | |
|-------------------|------------------|-----|-----|-----|---|-----|----|-----|-----|-----|-----|-----|----|-----|---|-----|----|-----|-----|-----|
| input_il6 | 0.1 | 0.1 | 0.5 | 0.5 | 1 | 1 | 10 | 10 | 100 | 100 | 2.5 | 2.5 | 25 | 25 | 5 | 5 | 50 | 50 | 500 | 500 |

Table S40: Model parameters modified for experiment braun app hep 2014 04 22 qPCR 140604 IL6DR Rux 24h SOCS3. Different columns indicate different conditions.

4.32 Experiment: braun app hep 2014 05 19 qPCR 140604 IL6DR Rux 24h SOCS3

4.32.1 Model fit and plots

The model observables and the experimental data is shown in Figure S58. The 2 necessary parameter transformations are listed in Table S41. Note that transformations with only one entry are the same for all experimental conditions corresponding to this experiment.

Figure S58: braun_app_hep_2014_05_19_qPCR_140604_IL6DR_Rux_24h_SOCS3 observables and experimental data for the experiment.

4.32.2 Condition dependent parameter changes

The following model parameters were changed to simulate these experimental conditions:

| Parameter | Condition values | | | | | | | | | | | | | | | | | | | |
|-------------------|------------------|-----|-----|-----|---|-----|----|-----|-----|-----|-----|-----|----|-----|---|-----|----|-----|-----|-----|
| input_il6 | 0.1 | 0.1 | 0.5 | 0.5 | 1 | 1 | 10 | 10 | 100 | 100 | 2.5 | 2.5 | 25 | 25 | 5 | 5 | 50 | 50 | 500 | 500 |
| input_ruxolitinib | 0 | 500 | 0 | 500 | 0 | 500 | 0 | 500 | 0 | 500 | 0 | 500 | 0 | 500 | 0 | 500 | 0 | 500 | 0 | 500 |

Table S41: Model parameters modified for experiment braun app hep 2014 05 19 qPCR 140604 IL6DR Rux 24h SOCS3. Different columns indicate different conditions.

4.33 Experiment: braun hep 2011 09 06 DRTC

4.33.1 Comments

Experimenter: Svantje Sobotta
 Date: 2011-09-06
 Cells: primary mouse hepatocytes
 Treatment: IL-6 0.5-5-50-500 ng/ml DRTC

4.33.2 Model fit and plots

The model observables and the experimental data is shown in Figure S59. The necessary parameter transformation is listed in Table S42.

Figure S59: braun_hep_2011_09_06_DRTC observables and experimental data for the experiment.

4.33.3 Condition dependent parameter changes

The following model parameters were changed to simulate these experimental conditions:

| Parameter | Condition values | | | |
|-----------|------------------|---|----|-----|
| input_il6 | 0.5 | 5 | 50 | 500 |

Table S42: Model parameters modified for experiment braun hep 2011 09 06 DRTC. Different columns indicate different conditions.

4.34 Experiment: braun hep 2011 04 04 STAT3 pY degree replicates

4.34.1 Comments

Experimenter: Svantje Sobotta, Martin Boehm
 Date: 2013-08-14
 Cells: primary mouse hepatocytes
 Treatment: IL-6 dose 40 ng/ml
 Technique: mass spectrometry

4.34.2 Model fit and plots

The model observables and the experimental data is shown in Figure S60. The necessary parameter transformation is listed in Table S44.

Figure S60: braun_hep_2011_04_04_STAT3_pY_degree_replicates observables and experimental data for the experiment.

4.34.3 Observables

The following observables are added in this data set:

| Observable | | Equations |
|---------------|----------|--------------------------------|
| pSTAT3_ms [%] | y | $100 \cdot [\text{pSTAT3rel}]$ |
| | σ | sd_pSTAT3_ms |

Table S43: Observables added for experiment braun_hep_2011_04_04_STAT3_pY_degree_replicates

4.34.4 Condition dependent parameter changes

The following model parameters were changed to simulate these experimental conditions:

| Parameter | Condition values | |
|-----------|------------------|----|
| input_il6 | 0 | 40 |

Table S44: Model parameters modified for experiment braun hep 2011 04 04 STAT3 pY degree replicates. Different columns indicate different conditions.

4.35 Experiment: braun hep 2013 07 08 qPCR Socs3 Stat3

4.35.1 Comments

Experimenter: Svantje Sobotta

Date: 2013-07-08

Cells: primary mouse hepatocytes

Treatment: IL-6 dose response 40 ng/ml = 1 nmol/l

values normalized by HPRT

4.35.2 Model fit and plots

The model observables and the experimental data is shown in Figure S61. The necessary parameter transformation is listed in Table S45.

Figure S61: braun_hep_2013_07_08_qPCR_Socs3_Stat3 observables and experimental data for the experiment.

4.35.3 Condition dependent parameter changes

The following model parameters were changed to simulate these experimental conditions:

| Parameter | Condition values |
|-----------|------------------|
| input_il6 | 0 40 |

Table S45: Model parameters modified for experiment braun hep 2013 07 08 qPCR Socs3 Stat3. Different columns indicate different conditions.

4.36 Experiment: braun hep 2011 12 12 Stattic Stat3 Inhibitor DR

4.36.1 Comments

Experimenter: Svantje Sobotta

Date: 2011-12-12

Cells: primary mouse hepatocytes

Treatment: input_stattic dose response 0 to 60 $\mu\text{mol/l}$, IL-6 40 ng/ml

4.36.2 Model fit and plots

The model observables and the experimental data is shown in Figure S62. The necessary parameter transformation is listed in Table S46.

Figure S62: braun_hep_2011_12_12_Stattic_Stat3_Inhibitor_DR observables and experimental data for the experiment.

4.36.3 Condition dependent parameter changes

The following model parameters were changed to simulate these experimental conditions:

| Parameter | Condition values | | | | | |
|---------------|------------------|---|----|----|---|----|
| input_stattic | 0 | 1 | 10 | 20 | 5 | 50 |

Table S46: Model parameters modified for experiment braun hep 2011 12 12 Stattic Stat3 Inhibitor DR. Different columns indicate different conditions.

4.37 Experiment: braun hep 2012 01 10 Stattic Stat3 Inhibitor DR

4.37.1 Comments

Experimenter: Svantje Sobotta

Date: 2012-01-10

Cells: primary mouse hepatocytes

Treatment: input_stattic dose response 0 to 60 $\mu\text{mol/l}$, IL-6 40 ng/ml

4.37.2 Model fit and plots

The model observables and the experimental data is shown in Figure S63. The necessary parameter transformation is listed in Table S47.

Figure S63: braun_hep_2012_01_10_Stattic_Stat3_Inhibitor_DR observables and experimental data for the experiment.

4.37.3 Condition dependent parameter changes

The following model parameters were changed to simulate these experimental conditions:

| Parameter | Condition values | | | | | | |
|---------------|------------------|----|----|----|----|----|----|
| input_stattic | 0 | 20 | 25 | 30 | 40 | 50 | 60 |

Table S47: Model parameters modified for experiment braun hep 2012 01 10 Stattic Stat3 Inhibitor DR. Different columns indicate different conditions.

4.38 Experiment: braun hep 2012 01 23 Stattic Stat3 Inhibitor TC

4.38.1 Comments

Experimenter: Svantje Sobotta

Date: 2012-01-23

Cells: primary mouse hepatocytes

Treatment: IL-6 dose 50 ng/ml, Stattic 40 μ mol/l

4.38.2 Model fit and plots

The model observables and the experimental data is shown in Figure S64. The 2 necessary parameter transformations are listed in Table S48. Note that transformations with only one entry are the same for all experimental conditions corresponding to this experiment.

Figure S64: braun_hep_2012_01_23_Stattic_Stat3_Inhibitor_TC observables and experimental data for the experiment.

4.38.3 Condition dependent parameter changes

The following model parameters were changed to simulate these experimental conditions:

| Parameter | Condition values |
|---------------|------------------|
| input_il6 | 50 |
| input_stattic | 0 40 |

Table S48: Model parameters modified for experiment braun hep 2012 01 23 Stattic Stat3 Inhibitor TC. Different columns indicate different conditions.

4.39 Experiment: braun hep 2012 01 23 Stattic Stat3 Inhibitor

4.39.1 Comments

Experimenter: Svantje Sobotta

Date: 2012-01-23

Cells: primary mouse hepatocytes

Treatment: IL-6 dose response 0.0005-500 40 ng/ml = 1 nmol/l, Stattic 40 μmol/l

4.39.2 Model fit and plots

The model observables and the experimental data is shown in Figure S65. The 2 necessary parameter transformations are listed in Table S49. Note that transformations with only one entry are the same for all experimental conditions corresponding to this experiment.

Figure S65: braun_hep_2012_01_23_Stattic_Stat3_Inhibitor observables and experimental data for the experiment.

4.39.3 Condition dependent parameter changes

The following model parameters were changed to simulate these experimental conditions:

| Parameter | Condition values | | | | | | | | | | | | | | | | | | | |
|---------------|------------------|----|--------|--------|-------|-------|------|------|-----|-----|-----|-----|-----|-----|---|----|----|----|-----|-----|
| input_il6 | 0 | 0 | 0.0005 | 0.0005 | 0.005 | 0.005 | 0.05 | 0.05 | 0.5 | 0.5 | 100 | 100 | 200 | 200 | 5 | 5 | 50 | 50 | 500 | 500 |
| input_stattic | 0 | 40 | 0 | 40 | 0 | 40 | 0 | 40 | 0 | 40 | 0 | 40 | 0 | 40 | 0 | 40 | 0 | 40 | 0 | 40 |

Table S49: Model parameters modified for experiment braun hep 2012 01 23 Stattic Stat3 Inhibitor. Different columns indicate different conditions.

4.40 Experiment: braun hep 2012 02 14 Stattic Stat3 Inhibitor TC

4.40.1 Comments

Experimenter: Svantje Sobotta

Date: 2012-02-14

Cells: primary mouse hepatocytes

Treatment: IL-6 dose 50 ng/ml, Stattic 60 μ mol/l

4.40.2 Model fit and plots

The model observables and the experimental data is shown in Figure S66. The 2 necessary parameter transformations are listed in Table S50. Note that transformations with only one entry are the same for all experimental conditions corresponding to this experiment.

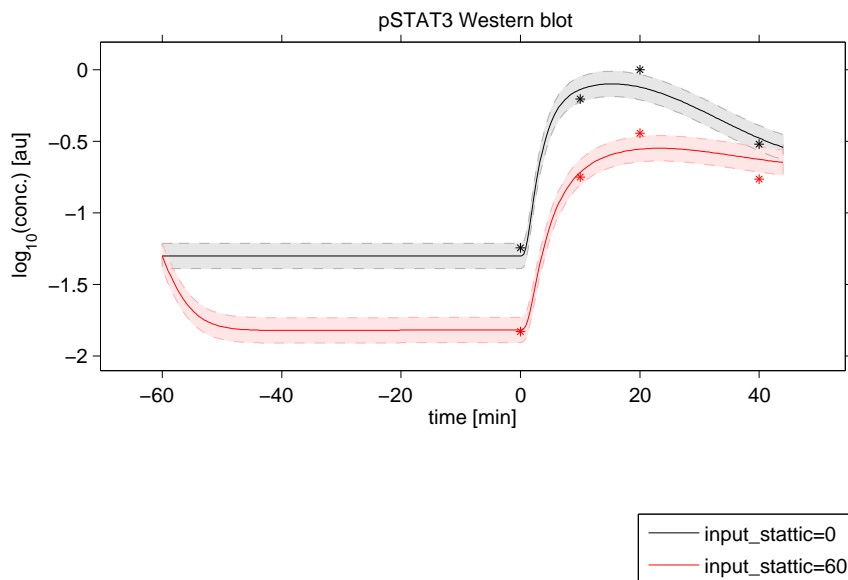

Figure S66: braun_hep_2012_02_14_Stattic_Stat3_Inhibitor_TC observables and experimental data for the experiment.

4.40.3 Condition dependent parameter changes

The following model parameters were changed to simulate these experimental conditions:

| Parameter | Condition values |
|---------------|------------------|
| input_il6 | 50 |
| input_stattic | 0 60 |

Table S50: Model parameters modified for experiment braun hep 2012 02 14 Stattic Stat3 Inhibitor TC. Different columns indicate different conditions.

4.46.1 Comments

Experimenter: Svantje Sobotta

Date: 2013-10-08

Cells: primary mouse hepatocytes

Treatment: IL-6 dose response 0-500 40 ng/ml, Ruxolitinib 500 nmol/l

4.46.2 Model fit and plots

The model observables and the experimental data is shown in Figure S72. The 2 necessary parameter transformations are listed in Table S56. Note that transformations with only one entry are the same for all experimental conditions corresponding to this experiment.

Figure S72: braun_hep_2013_09_30_Ruxolitinib_Inhibitor_TC observables and experimental data for the experiment.

4.46.3 Condition dependent parameter changes

The following model parameters were changed to simulate these experimental conditions:

| Parameter | Condition values |
|-------------------|------------------|
| input_il6 | 100 |
| input_ruxolitinib | 0 500 |

Table S56: Model parameters modified for experiment braun hep 2013 09 30 Ruxolitinib Inhibitor TC. Different columns indicate different conditions.

4.47 Experiment: xiaoyun nucSTAT3 Ratio

4.47.1 Model fit and plots

The model observables and the experimental data is shown in Figure S73. The necessary parameter transformation is listed in Table S57.

Figure S73: xiaoyun_nucSTAT3_Ratio observables and experimental data for the experiment.

4.47.2 Condition dependent parameter changes

The following model parameters were changed to simulate these experimental conditions:

| Parameter | Condition values |
|-----------|------------------|
| input_il6 | 500 |

Table S57: Model parameters modified for experiment xiaoyun nucSTAT3 Ratio. Different columns indicate different conditions.

4.48 Experiment: APP calibration 1h

4.48.1 Model fit and plots

The model observables and the experimental data is shown in Figure S74. The necessary parameter transformation is listed in Table S58.

Figure S74: APP_calibration_1h observables and experimental data for the experiment.

4.48.2 Condition dependent parameter changes

The following model parameters were changed to simulate these experimental conditions:

| Parameter | Condition values | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------|------------------|--------|-------|------|-----|-----|-----|---|----|-----|-----|-----|---|----|-----|-----|----|---|----|-----|-----|-----|---|----|-----|-----|----|---|----|-----|
| input.l6 | 0 | 0.0005 | 0.005 | 0.05 | 0.5 | 100 | 200 | 5 | 50 | 500 | 0.1 | 0.5 | 1 | 10 | 100 | 2.5 | 25 | 5 | 50 | 500 | 0.1 | 0.5 | 1 | 10 | 100 | 2.5 | 25 | 5 | 50 | 500 |

Table S58: Model parameters modified for experiment APP calibration 1h. Different columns indicate different conditions.

4.49 Experiment: braun calibration hep 2014 01 13 IL6DR 6h Replicate1

4.49.1 Model fit and plots

The model observables and the experimental data is shown in Figure S75. The necessary parameter transformation is listed in Table S59.

Figure S75: braun_calibration_hep_2014_01_13_IL6DR_6h_Replicate1 observables and experimental data for the experiment. Acute phase protein calibration data. Solid lines indicate model predictions, with dashed lines indicating standard deviation of the error model. Individual dots correspond to measured data points.

4.49.2 Condition dependent parameter changes

The following model parameters were changed to simulate these experimental conditions:

| Parameter | Condition values | | | | | | | | | |
|-----------|------------------|-----|---|----|-----|-----|----|---|----|-----|
| input_il6 | 0.1 | 0.5 | 1 | 10 | 100 | 2.5 | 25 | 5 | 50 | 500 |

Table S59: Model parameters modified for experiment braun calibration hep 2014 01 13 IL6DR 6h - Replicate1. Different columns indicate different conditions.

4.50 Experiment: braun calibration hep 2014 01 13 IL6DR 6h Replicate2

4.50.1 Model fit and plots

The model observables and the experimental data is shown in Figure S76. The necessary parameter transformation is listed in Table S60.

Figure S76: braun_calibration_hep_2014_01_13_IL6DR_6h_Replicate2 observables and experimental data for the experiment. Acute phase protein calibration data. Solid lines indicate model predictions, with dashed lines indicating standard deviation of the error model. Individual dots correspond to measured data points.

4.50.2 Condition dependent parameter changes

The following model parameters were changed to simulate these experimental conditions:

| Parameter | Condition values | | | | | | | | | |
|-----------|------------------|-----|---|----|-----|-----|----|---|----|-----|
| input_il6 | 0.1 | 0.5 | 1 | 10 | 100 | 2.5 | 25 | 5 | 50 | 500 |

Table S60: Model parameters modified for experiment braun calibration hep 2014 01 13 IL6DR 6h - Replicate2. Different columns indicate different conditions.

4.51 Experiment: braun calibration hep 2014 01 13 IL6DR 6h Replicate3

4.51.1 Model fit and plots

The model observables and the experimental data is shown in Figure S77. The necessary parameter transformation is listed in Table S61.

Figure S77: braun_calibration_hep_2014_01_13_IL6DR_6h_Replicate3 observables and experimental data for the experiment. Acute phase protein calibration data. Solid lines indicate model predictions, with dashed lines indicating standard deviation of the error model. Individual dots correspond to measured data points.

4.51.2 Condition dependent parameter changes

The following model parameters were changed to simulate these experimental conditions:

| Parameter | Condition values | | | | | | | | | |
|-----------|------------------|-----|---|----|-----|-----|----|---|----|-----|
| input_il6 | 0.1 | 0.5 | 1 | 10 | 100 | 2.5 | 25 | 5 | 50 | 500 |

Table S61: Model parameters modified for experiment braun calibration hep 2014 01 13 IL6DR 6h - Replicate3. Different columns indicate different conditions.

4.52 Experiment: braun calibration hep 2014 01 27 IL6DR 24h Replicate1

4.52.1 Model fit and plots

The model observables and the experimental data is shown in Figure S78. The necessary parameter transformation is listed in Table S62.

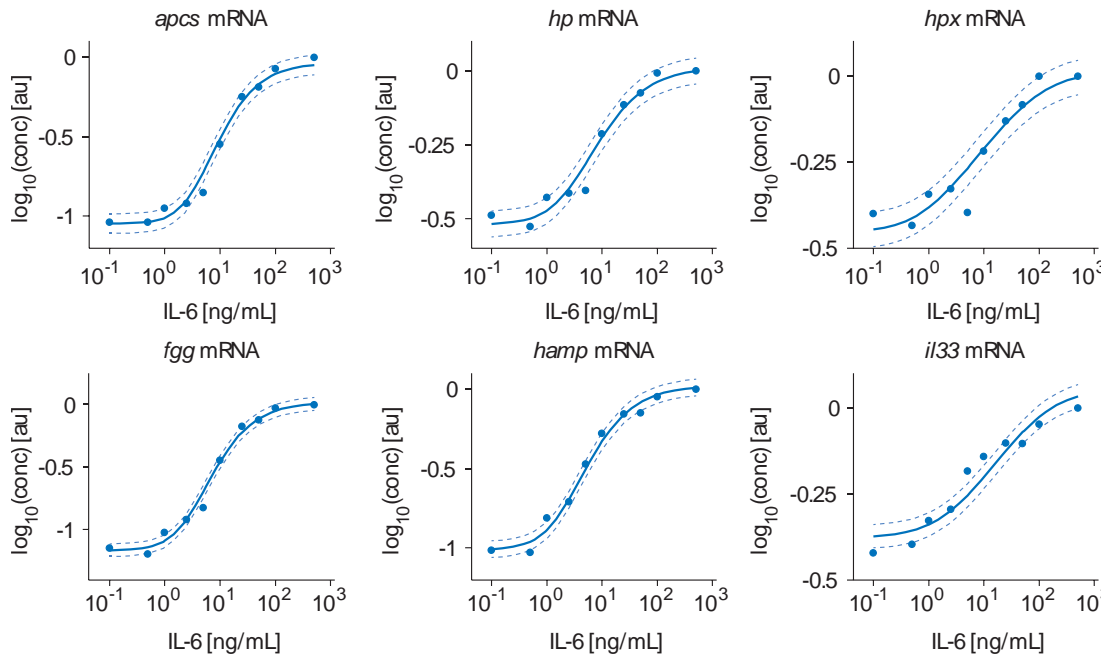

Figure S78: braun_calibration_hep_2014_01_27_IL6DR_24h_Replicate1 observables and experimental data for the experiment. Acute phase protein calibration data. Solid lines indicate model predictions, with dashed lines indicating standard deviation of the error model. Individual dots correspond to measured data points.

4.52.2 Condition dependent parameter changes

The following model parameters were changed to simulate these experimental conditions:

| Parameter | Condition values | | | | | | | | | |
|-----------|------------------|-----|---|----|-----|-----|----|---|----|-----|
| input_il6 | 0.1 | 0.5 | 1 | 10 | 100 | 2.5 | 25 | 5 | 50 | 500 |

Table S62: Model parameters modified for experiment braun calibration hep 2014 01 27 IL6DR 24h - Replicate1. Different columns indicate different conditions.

4.53 Experiment: braun calibration hep 2014 01 27 IL6DR 24h Replicate2

4.53.1 Model fit and plots

The model observables and the experimental data is shown in Figure S79. The necessary parameter transformation is listed in Table S63.

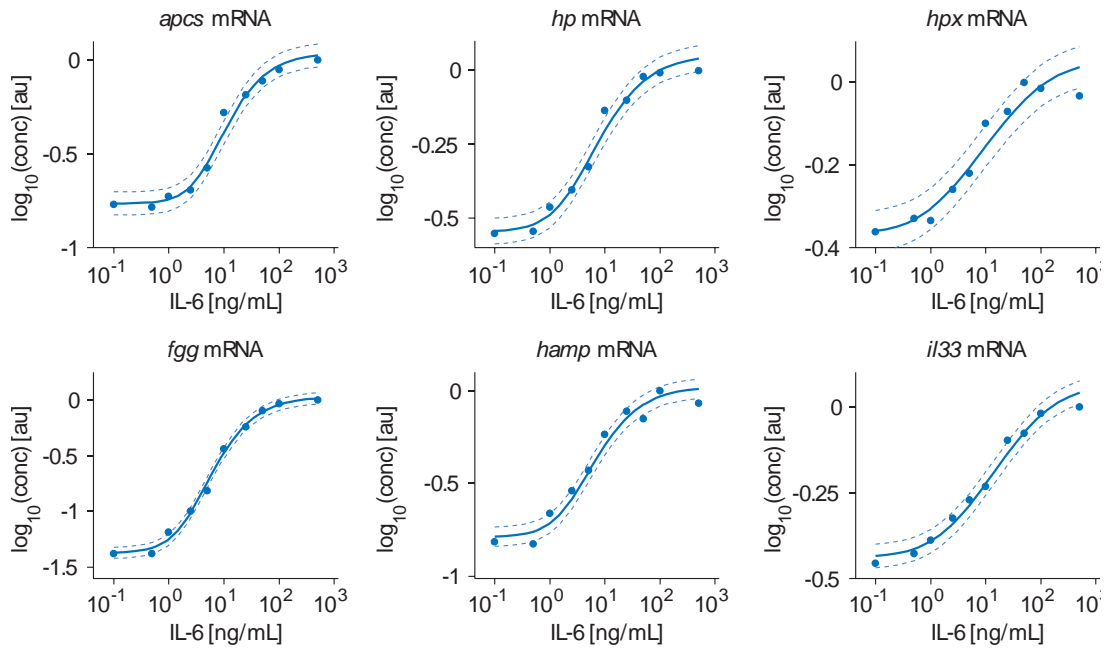

Figure S79: braun_calibration_hep_2014_01_27_IL6DR_24h_Replicate2 observables and experimental data for the experiment. Acute phase protein calibration data. Solid lines indicate model predictions, with dashed lines indicating standard deviation of the error model. Individual dots correspond to measured data points.

4.53.2 Condition dependent parameter changes

The following model parameters were changed to simulate these experimental conditions:

| Parameter | Condition values | | | | | | | | | |
|-----------|------------------|-----|---|----|-----|-----|----|---|----|-----|
| input_il6 | 0.1 | 0.5 | 1 | 10 | 100 | 2.5 | 25 | 5 | 50 | 500 |

Table S63: Model parameters modified for experiment braun calibration hep 2014 01 27 IL6DR 24h - Replicate2. Different columns indicate different conditions.

4.54 Experiment: braun calibration hep 2014 01 27 IL6DR 24h Replicate3

4.54.1 Model fit and plots

The model observables and the experimental data is shown in Figure S80. The necessary parameter transformation is listed in Table S64.

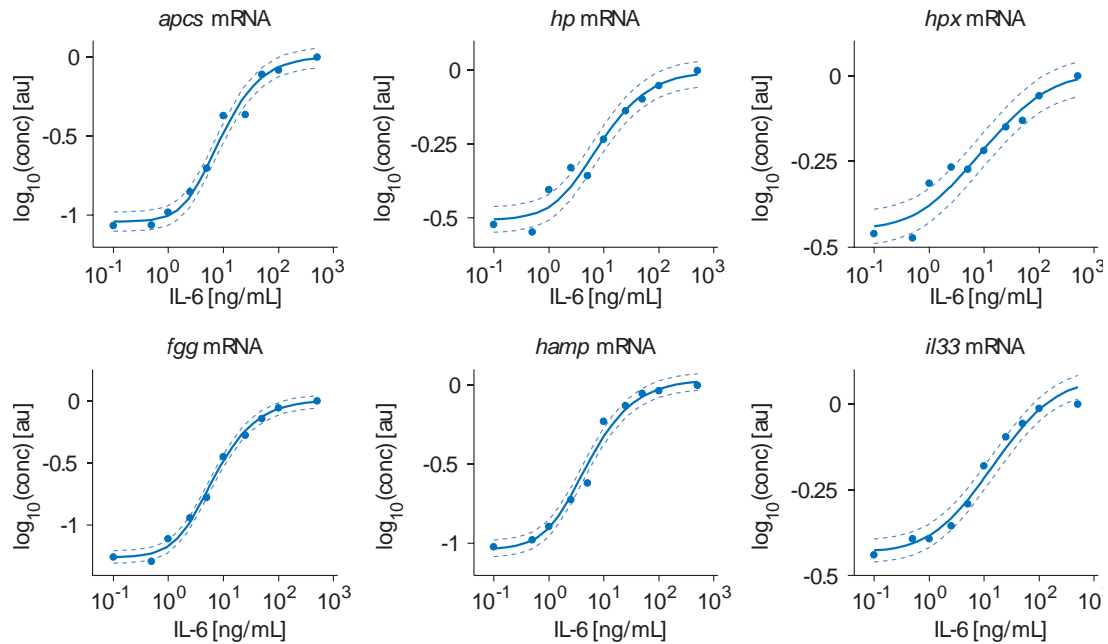

Figure S80: braun_calibration_hep_2014_01_27_IL6DR_24h_Replicate3 observables and experimental data for the experiment. Acute phase protein calibration data. Solid lines indicate model predictions, with dashed lines indicating standard deviation of the error model. Individual dots correspond to measured data points.

4.54.2 Condition dependent parameter changes

The following model parameters were changed to simulate these experimental conditions:

| Parameter | Condition values | | | | | | | | | |
|-----------|------------------|-----|---|----|-----|-----|----|---|----|-----|
| input_il6 | 0.1 | 0.5 | 1 | 10 | 100 | 2.5 | 25 | 5 | 50 | 500 |

Table S64: Model parameters modified for experiment braun calibration hep 2014 01 27 IL6DR 24h - Replicate3. Different columns indicate different conditions.

4.55 Experiment: xiaoyun calibration APP tc replicate1

4.55.1 Comments

Experimenter: Xiaoyun Huang
Cells: primary mouse hepatocytes
Treatment: 0, 40 and 100 ng/ml IL-6 constant

4.55.2 Model fit and plots

The model observables and the experimental data is shown in Figure S81. This experiment requires 7 custom inputs which are defined in Table S65. The necessary parameter transformation is listed in Table S67.

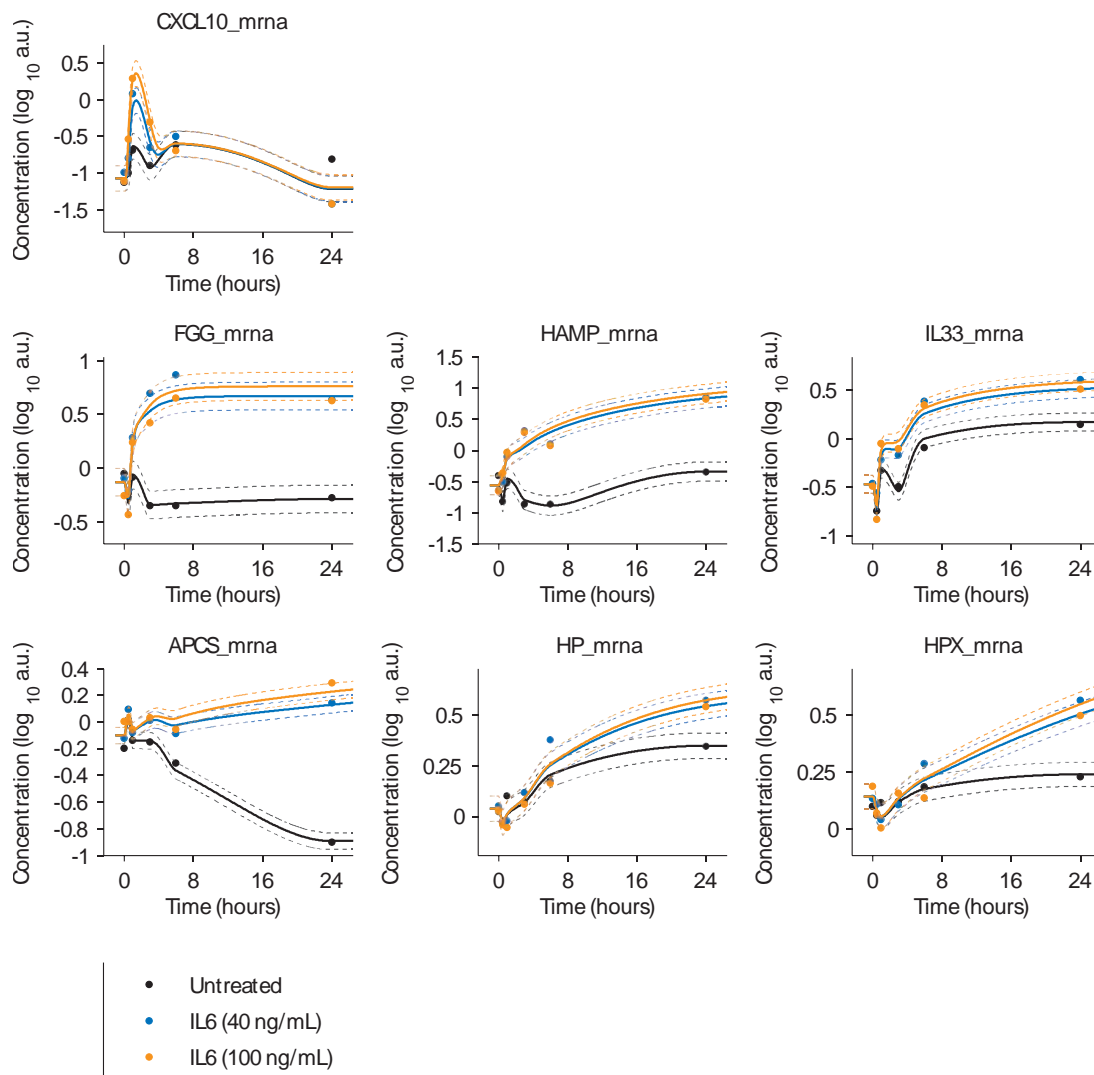

Figure S81: xiaoyun_calibration_APP_tc_replicate1 observables and experimental data for the experiment. Solid lines indicate model predictions, with dashed lines indicating standard deviation of the error model. Individual dots correspond to measured data points. The background signal of the control experiment is described by a monotonic spline and estimated from the control data.

| Input | Unit | Modified equation | Description |
|-------------------|----------------|-------------------|--|
| CXCL10_background | conc. [nmol/l] | monospline10(t) | Monotonic spline describing CXCL10 background of replicate 1 |
| APCS_background | conc. [nmol/l] | monospline10(t) | Monotonic spline describing APCS background of replicate 1 |
| FGG_background | conc. [nmol/l] | monospline10(t) | Monotonic spline describing FGG background of replicate 1 |
| HP_background | conc. [nmol/l] | monospline10(t) | Monotonic spline describing HP background of replicate 1 |
| HPX_background | conc. [nmol/l] | monospline10(t) | Monotonic spline describing HPX background of replicate 1 |
| IL33_background | conc. [nmol/l] | monospline10(t) | Monotonic spline describing IL33 background of replicate 1 |
| HAMP_background | conc. [nmol/l] | monospline10(t) | Monotonic spline describing HAMP background of replicate 1 |

Table S65: Inputs modified for experiment xiaoyun_calibration_APP_tc_replicate1

4.55.3 Observables

The following observables are added in this data set:

| Observable | Equations |
|------------------|--|
| CXCL10_mrna [au] | $y \log_{10}([\text{CXCL10_background}] + \text{offset_cxcl10_qpcr_tc} + [\text{CXCL10RNA}] \cdot \text{scale_cxcl10_qpcr_tc.1})$ $\sigma \text{sd_cxcl10_qpcr_tc.1}$ |
| APCS_mrna [au] | $y \log_{10}([\text{APCS_background}] + \text{offset_apcs_qpcr_tc} + [\text{APCSRNA}] \cdot \text{scale_apcs_qpcr_tc.1})$ $\sigma \text{sd_apcs_qpcr_tc.1}$ |
| FGG_mrna [au] | $y \log_{10}([\text{FGG_background}] + \text{offset_fgg_qpcr_tc} + [\text{FGGRNA}] \cdot \text{scale_fgg_qpcr_tc.1})$ $\sigma \text{sd_fgg_qpcr_tc.1}$ |
| HP_mrna [au] | $y \log_{10}([\text{HP_background}] + \text{offset_hp_qpcr_tc} + [\text{HPRNA}] \cdot \text{scale_hp_qpcr_tc.1})$ $\sigma \text{sd_hp_qpcr_tc.1}$ |
| HPX_mrna [au] | $y \log_{10}([\text{HPX_background}] + \text{offset_hpx_qpcr_tc} + [\text{HPXRNA}] \cdot \text{scale_hpx_qpcr_tc.1})$ $\sigma \text{sd_hpx_qpcr_tc.1}$ |
| IL33_mrna [au] | $y \log_{10}([\text{IL33_background}] + \text{offset_il33_qpcr_tc} + [\text{IL33RNA}] \cdot \text{scale_il33_qpcr_tc.1})$ $\sigma \text{sd_il33_qpcr_tc.1}$ |
| HAMP_mrna [au] | $y \log_{10}([\text{HAMP_background}] + \text{offset_hamp_qpcr_tc} + [\text{HAMPRNA}] \cdot \text{scale_hamp_qpcr_tc.1})$ $\sigma \text{sd_hamp_qpcr_tc.1}$ |

Table S66: Observables added for experiment xiaoyun_calibration_APP_tc_replicate1

4.55.4 Condition dependent parameter changes

The following model parameters were changed to simulate these experimental conditions:

| Parameter | Condition values |
|-----------|------------------|
| input_il6 | 0 100 40 |

Table S67: Model parameters modified for experiment xiaoyun_calibration_APP_tc_replicate1. Different columns indicate different conditions.

4.56 Experiment: xiaoyun calibration APP tc replicate2

4.56.1 Comments

Experimenter: Xiaoyun Huang
Cells: primary mouse hepatocytes
Treatment: 0, 40 and 100 ng/ml IL-6 constant

4.56.2 Model fit and plots

The model observables and the experimental data is shown in Figure S82. This experiment requires 7 custom inputs which are defined in Table S68. The necessary parameter transformation is listed in Table S70.

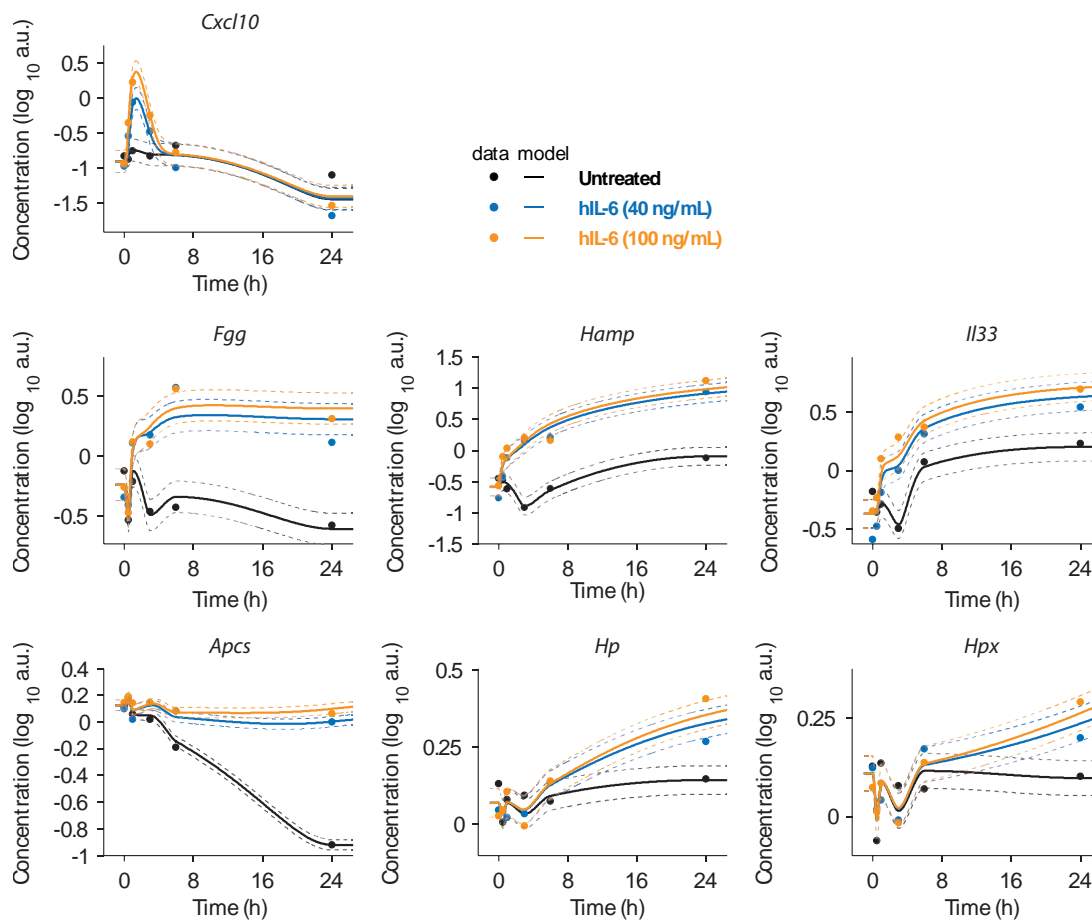

Figure S82: xiaoyun_calibration_APP_tc_replicate2 observables and experimental data for the experiment. Solid lines indicate model predictions, with dashed lines indicating standard deviation of the error model. Individual dots correspond to measured data points. The background signal of the control experiment is described by a monotonic spline and estimated from the control data.

| Input | Unit | Modified equation | Description |
|-------------------|----------------|-------------------|--|
| CXCL10_background | conc. [nmol/l] | monospline10(t) | Monotonic spline describing CXCL10 background of replicate 2 |
| APCS_background | conc. [nmol/l] | monospline10(t) | Monotonic spline describing APCS background of replicate 2 |
| FGG_background | conc. [nmol/l] | monospline10(t) | Monotonic spline describing FGG background of replicate 2 |

Table S101: Model parameters modified for experiment xiaoyun validation nucSTAT3 validation 20150528 nExpID2. Different columns indicate different conditions.

5 Estimated model parameters

This section lists all the model parameters used in the model. Parameters highlighted in red color indicate parameter values close to their bounds. The parameter name prefix `offset_` indicates a offset of the experimental data. The parameter name prefix `scale_` indicates a scaling factor of the experimental data. The parameter name prefix `sd_` indicates the magnitude of the measurement noise for a specific measurement.

| | name | θ_{min} | $\hat{\theta}$ | θ_{max} | log | non-log $\hat{\theta}$ | fitted |
|----|-----------------|----------------|----------------|----------------|-----|------------------------|--------|

Table S102: Estimated parameter values

$\hat{\theta}$ indicates the estimated value of the parameters. θ_{min} and θ_{max} indicate the upper and lower bounds for the parameters. The log-column indicates if the value of a parameter was log-transformed. If log = 1 the non-log-column indicates the non-logarithmic value of the estimate. The fitted-column indicates if the parameter value was estimated (1), was temporarily fixed (0) or if its value was fixed to a constant value (2).

| | name | θ_{min} | $\hat{\theta}$ | θ_{max} | log | non-log $\hat{\theta}$ | fitted |
|----|---------------|----------------|----------------|----------------|-----|------------------------|--------|

Table S105: Estimated parameter values

$\hat{\theta}$ indicates the estimated value of the parameters. θ_{min} and θ_{max} indicate the upper and lower bounds for the parameters. The log-column indicates if the value of a parameter was log-transformed. If log = 1 the non-log-column indicates the non-logarithmic value of the estimate. The fitted-column indicates if the parameter value was estimated (1), was temporarily fixed (0) or if its value was fixed to a constant value (2).

Table S108: Estimated parameter values

$\hat{\theta}$ indicates the estimated value of the parameters. θ_{min} and θ_{max} indicate the upper and lower bounds for the parameters. The log-column indicates if the value of a parameter was log-transformed. If log = 1 the non-log-column indicates the non-logarithmic value of the estimate. The fitted-column indicates if the parameter value was estimated (1), was temporarily fixed (0) or if its value was fixed to a constant value (2).

| | name | θ_{min} | $\hat{\theta}$ | θ_{max} | log | non-log $\hat{\theta}$ | fitted |

Table S111: Estimated parameter values

$\hat{\theta}$ indicates the estimated value of the parameters. θ_{min} and θ_{max} indicate the upper and lower bounds for the parameters. The log-column indicates if the value of a parameter was log-transformed. If log = 1 the non-log-column indicates the non-logarithmic value of the estimate. The fitted-column indicates if the parameter value was estimated (1), was temporarily fixed (0) or if its value was fixed to a constant value (2).

| | name | θ_{min} | $\hat{\theta}$ | θ_{max} | log | non-log $\hat{\theta}$ | fitted |

Table S114: Estimated parameter values

$\hat{\theta}$ indicates the estimated value of the parameters. θ_{min} and θ_{max} indicate the upper and lower bounds for the parameters. The log-column indicates if the value of a parameter was log-transformed. If log = 1 the non-log-column indicates the non-logarithmic value of the estimate. The fitted-column indicates if the parameter value was estimated (1), was temporarily fixed (0) or if its value was fixed to a constant value (2).

Table S116: Estimated parameter values

$\hat{\theta}$ indicates the estimated value of the parameters. θ_{min} and θ_{max} indicate the upper and lower bounds for the parameters. The log-column indicates if the value of a parameter was log-transformed. If log = 1 the non-log-column indicates the non-logarithmic value of the estimate. The fitted-column indicates if the parameter value was estimated (1), was temporarily fixed (0) or if its value was fixed to a constant value (2).
