Supplementary figure legends

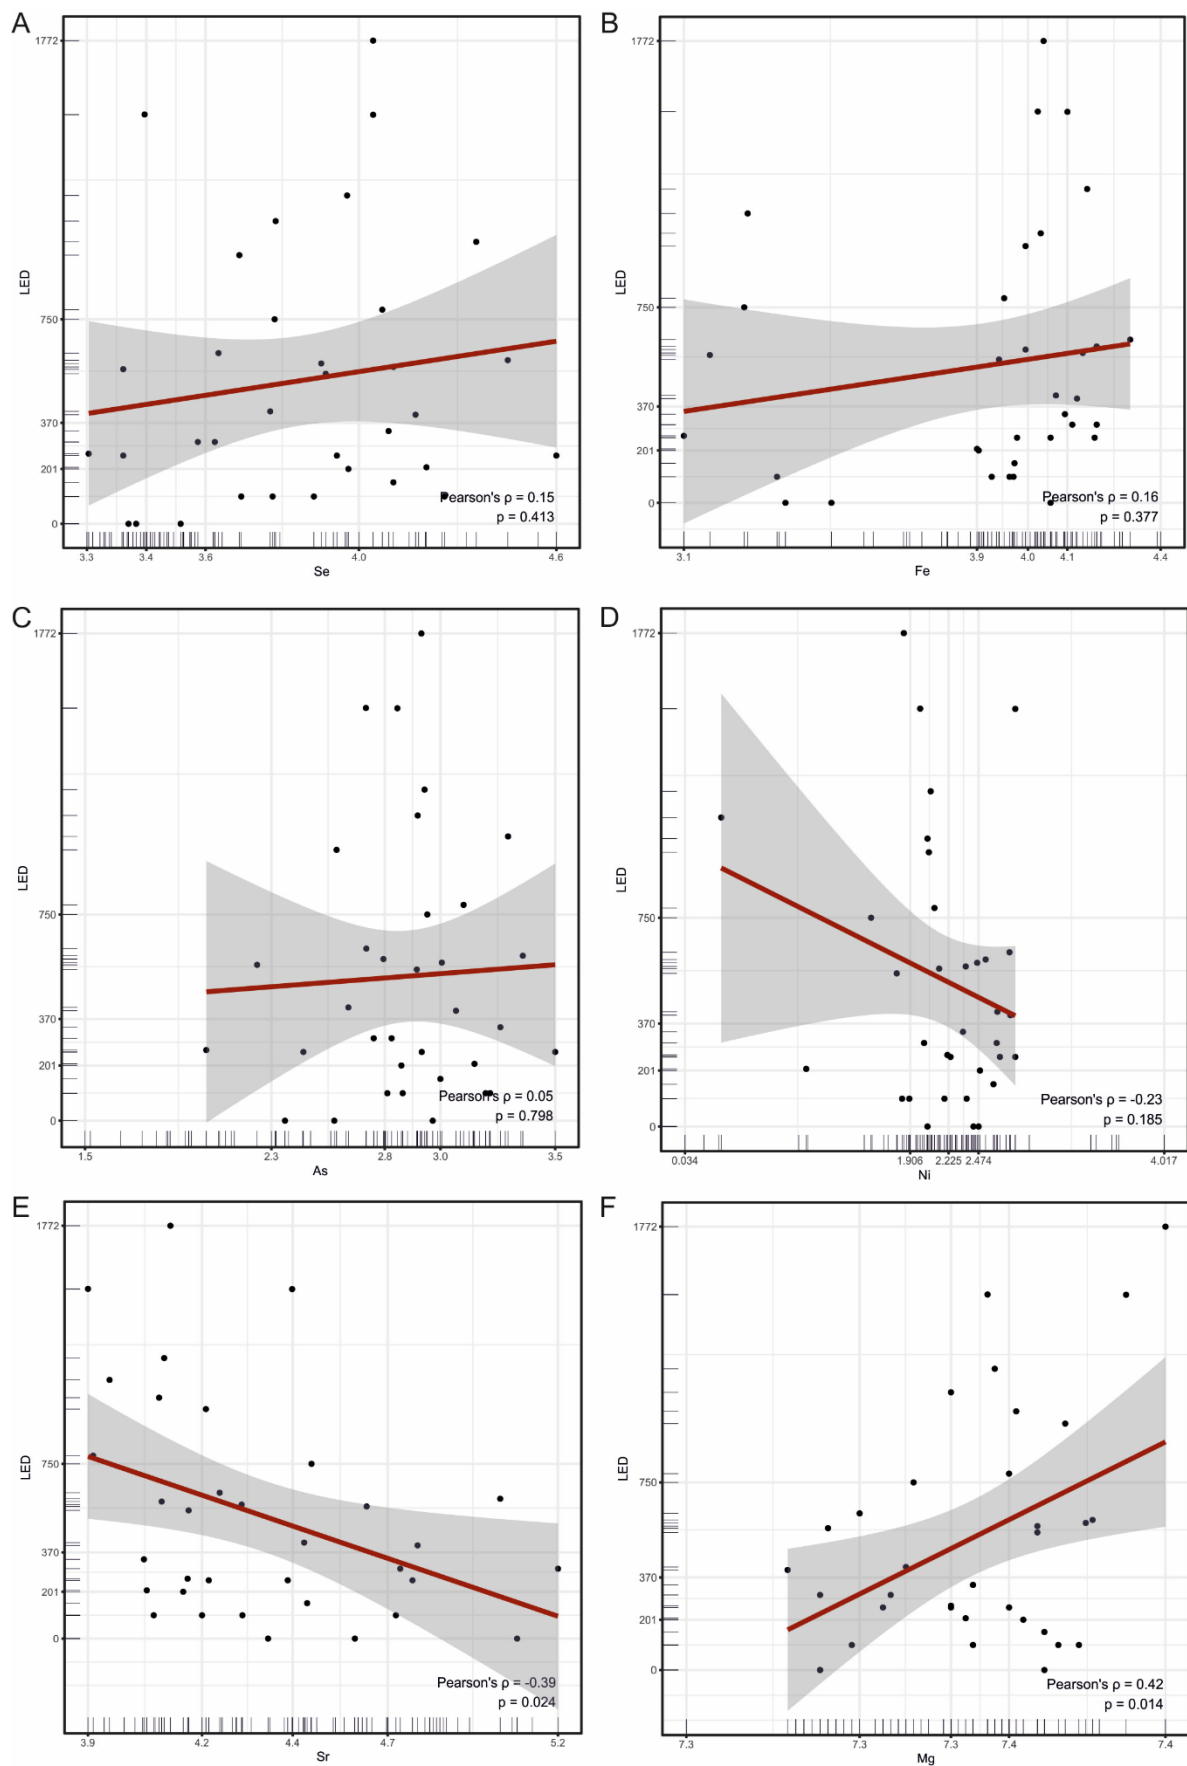

Supplementary Figure S1: Summary of the clinical parameters. The grouping (Control vs Parkinson's disease patients) was modeled using a logistic regression model based on the concentration levels of the elements in the final feature set as predictors. Patients were assigned elemental scores using the resulting model. The model shows no correlation between element concentration scores and clinical parameters (MDS-UPDRS total and MDS-UPDRS part III, PD-NMS, H&Y stage, disease duration and age).

Supplementary Figure S2: Correlation of LED to the six final elements. No significant correlations remain after adjustment for multiple testing. LED = levodopa equivalent dose.

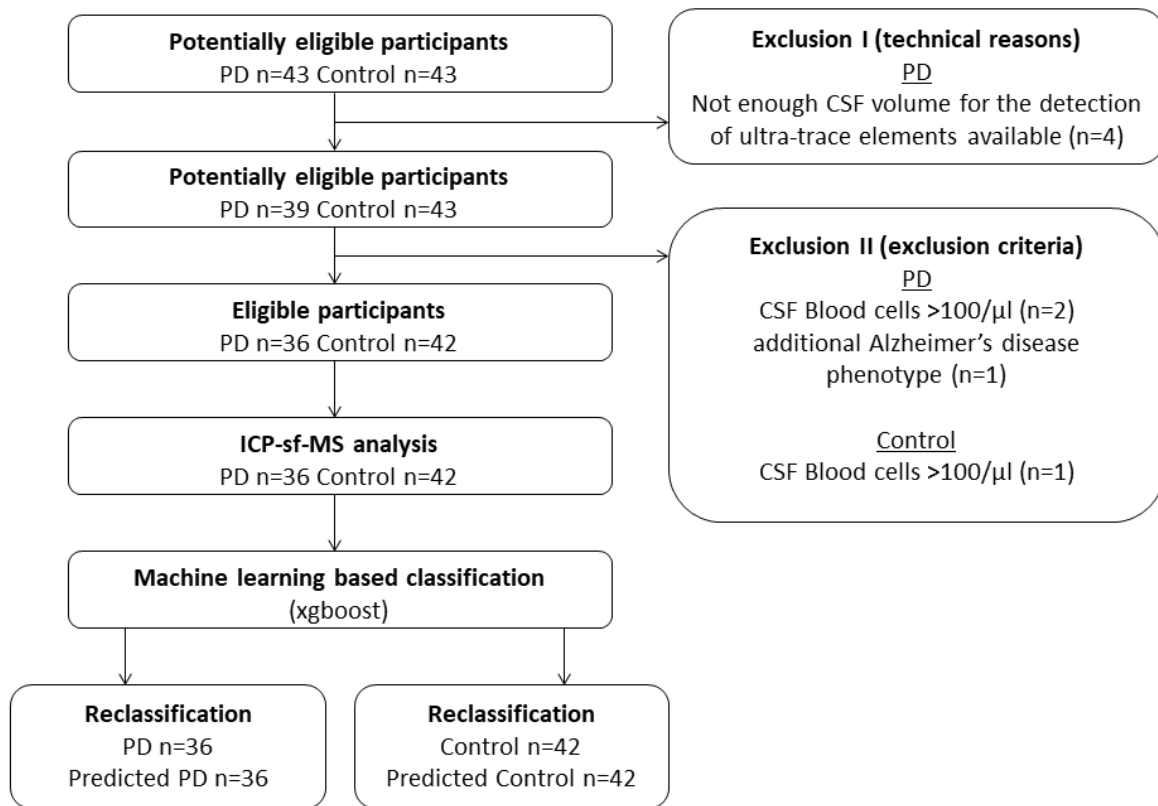

Supplementary Figure S3: Diagram showing flow of patients through the study. PD = Parkinson's disease.

Supplementary Table S2: Table showing levodopa equivalent dose (LED) for the PD patients.

Supplementary methods – ICP-OES and ICP-sf-MS

Reference standards:

Plasma (simulating protein content of CSF) and urine (simulating the high salt content of CSF) were used.

- Plasma ClinCal 9985 (Recipe, München, Germany)

- Urine Clicheck Control 8847-8849 (Recipe, München, Germany)

Supplementary methods - Machine Learning Algorithms

The machine learning algorithms were trained through the blkbox [1] R-package. For some algorithms blkbox in turn relies on the caret [2] R-package, which by default offers a grid search for the important tuning parameters in each model. Here we list the applied machine learning algorithms with the values of their respective most important tuning parameters:

- randomforest [3]
500 trees, mtry = 4
- kknn [4]
k = 7, distance = 3, kernel = optimal, scale = T
- bartmachine [5]
50 trees, num_burn_in = 250, num_iterations_after_burn_in = 1000, beta = 2, k = 2, q = 0.9, nu = 3, mtry = 4
- party [6]
500 trees, mtry = 4, teststat = quad, testtype = Univ, replace = FALSE
- elastic net regularized logistic regression : glmnet (through caret) [7]
alpha = <grid search>, lambda = <grid search>
- Nearest Shrunken Centroids: PamR (through caret) [8]
threshold: <grid search>
- Neural net: nnet (through caret) [9]
MaxNWts = 1000000, size = <grid search>, decay = <grid search>
- SVM [10]
linear kernel, gamma = 1/18, scale = TRUE
- xgboost [11]
type = logistic, max.depth = 4, eta = 1, nround = 10
