Table S1. List of cognitive performance tests

Table S2. Associations between identified metabolites/ratio and cognitive performance tests adjusting for age, gender, years of education, APOE ε4, BMI

Table S3. Logistic regression of metabolite marker panel-based RF score to discriminate NCI (converters) vs. NCI (non-converters) adjusting for gender, years of education, APOE ε4, and BMI

Table S4. PDS of metabolic pathways differentially expressed in participants with cognitive decline

Table S5. Associations between identified metabolic pathways and cognitive performance tests adjusting for age, gender, years of education, APOE ε4, and BMI

Table S6. Logistic regression of metabolic pathway panel-based RF score to discriminate NCI (converters) vs. NCI (non-converters) adjusting for gender, years of education, APOE ε4, and BMI

Table S7. Levels of detected metabolites across clinical groups in brain samples

Table S8. Levels of detected metabolites across clinical groups in serum samples

Table S9. PDS of mapped metabolic pathways across clinical groups in brain samples

Table S10. PDS of detected metabolic pathways across clinical groups in serum samples

Table S11. Levels of identified metabolites in samples with both brain and blood metabolomics data

Table S12. Mixed effects model of metabolite marker panel-based RF score adjusting for age, gender, years of education, APOE ε4, and BMI

Table S13. Associations between identified metabolites/ratio and cognitive performance domains adjusting for age, gender, years of education, APOE ε4, and BMI.

Table S14. P values and Q values of identified metabolites across clinical groups in brain samples using ordinal regression.

Table S15. P values and Q values of identified metabolites across clinical groups in serum samples using logistic regression.

Table S16. P values and Q values of identified pathway across clinical groups in brain samples using ordinal regression.

Table S17. P values and Q values of identified pathway across clinical groups in serum samples using logistic regression.

Table S18. P values identified pathway across clinical groups in serum samples adjusting for other potential confounders using logistic regression.

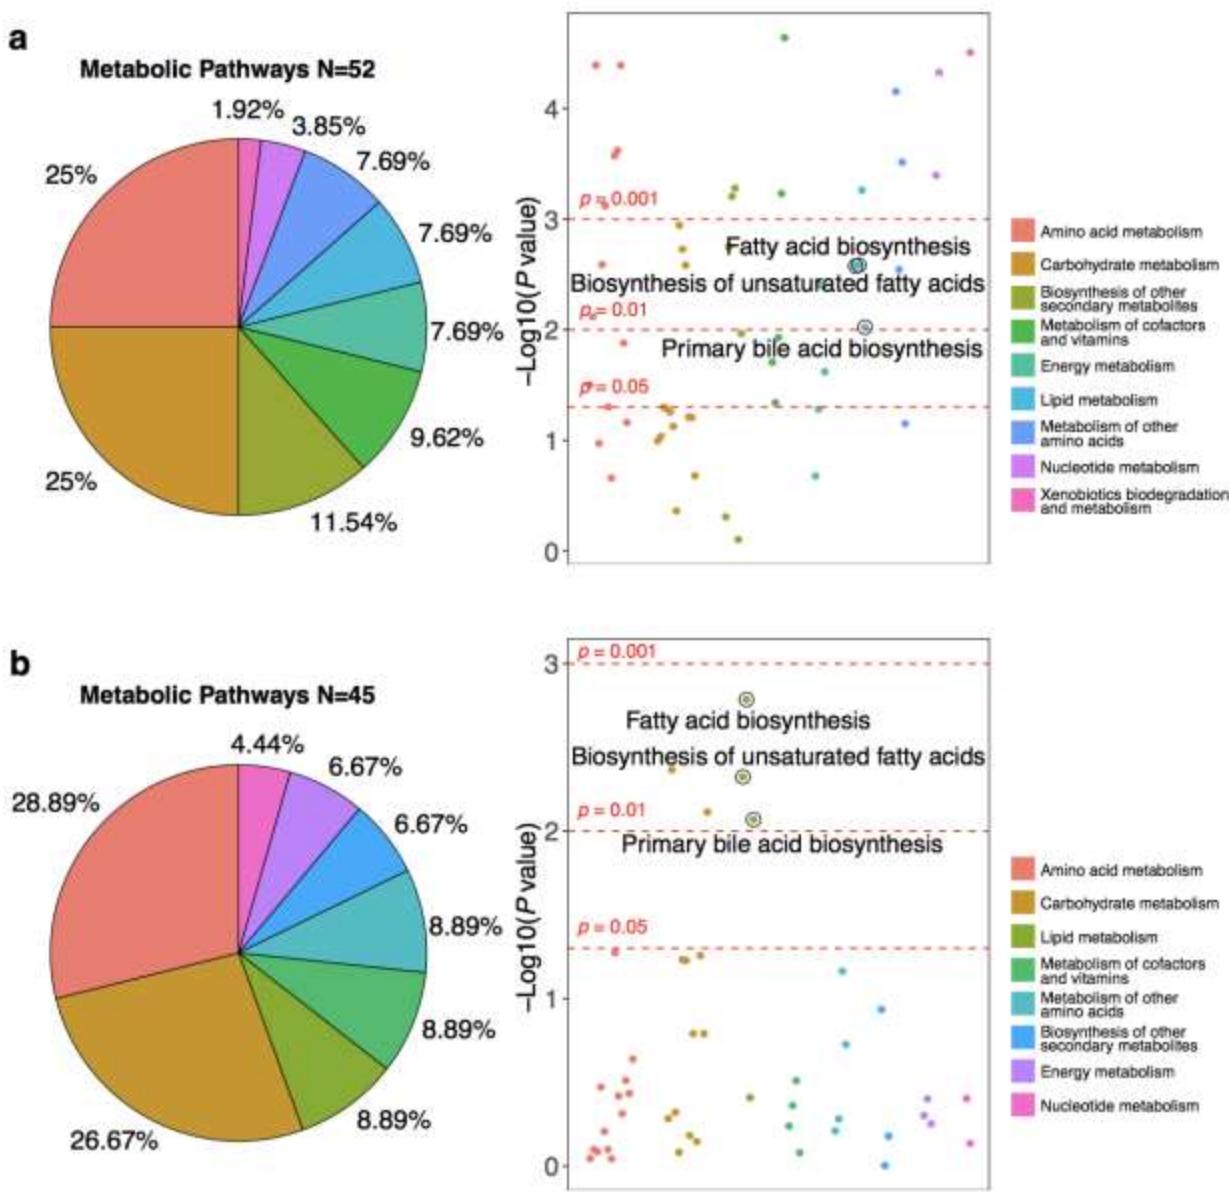

Figure S1. Brain metabolic pathways and serum metabolic pathway compositions and alterations.

(a) Left panel: the mapped pathway composition in brain. Right panel: $-\log_{10}$ (P -value) across clinical groups (NCI, MCI, AD). (b) Left panel: the mapped pathways composition in serum. Right panel: $-\log_{10}$ (P -value) across clinical groups (NCI, MCI/AD). Abbreviations: AD – Alzheimer's disease; MCI – mild cognitive impairment; NCI: no cognitive impairment

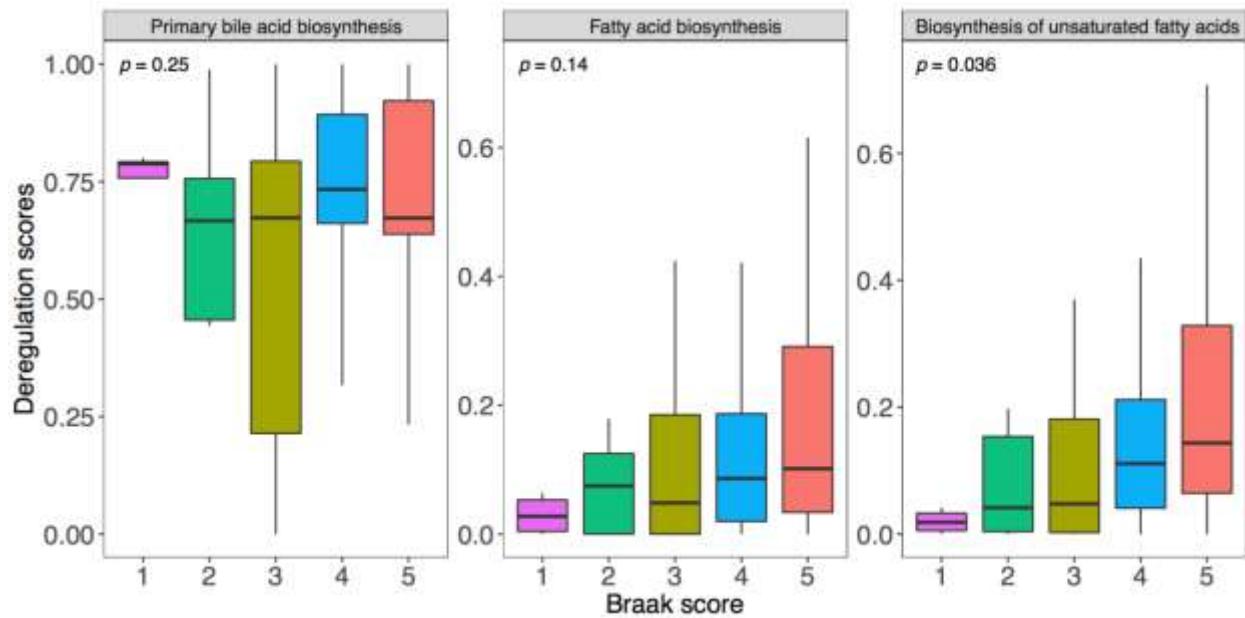

Figure S2. PDS of metabolic pathways across Braak scores in brain.

Boxplots showing group differences and *P*-values for identified pathways across Braak groups for brain tissues.

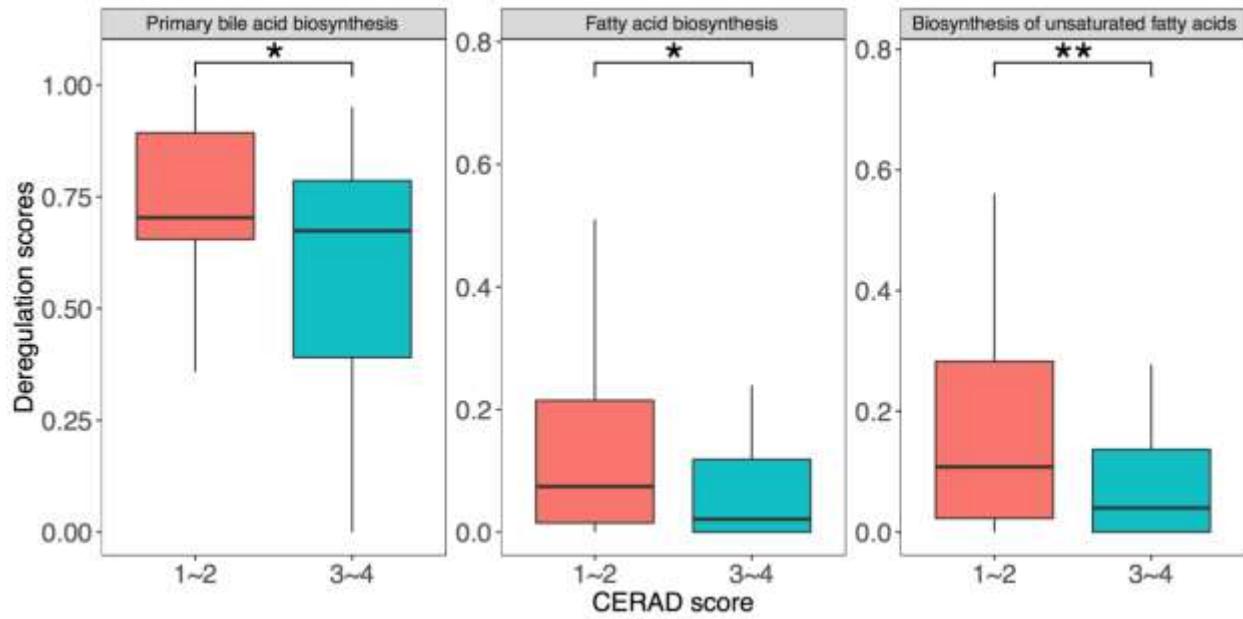

Figure S3. PDS of metabolic pathways across CERAD scores in brain.

Boxplots showing group differences and significances for identified pathways across CERAD groups for brain tissues. * P -value < 0.05 , ** P -value < 0.01 , *** P -value < 0.001 , Wilcoxon rank sum test. CERAD, Consortium to Establish a Registry for Alzheimer's Disease

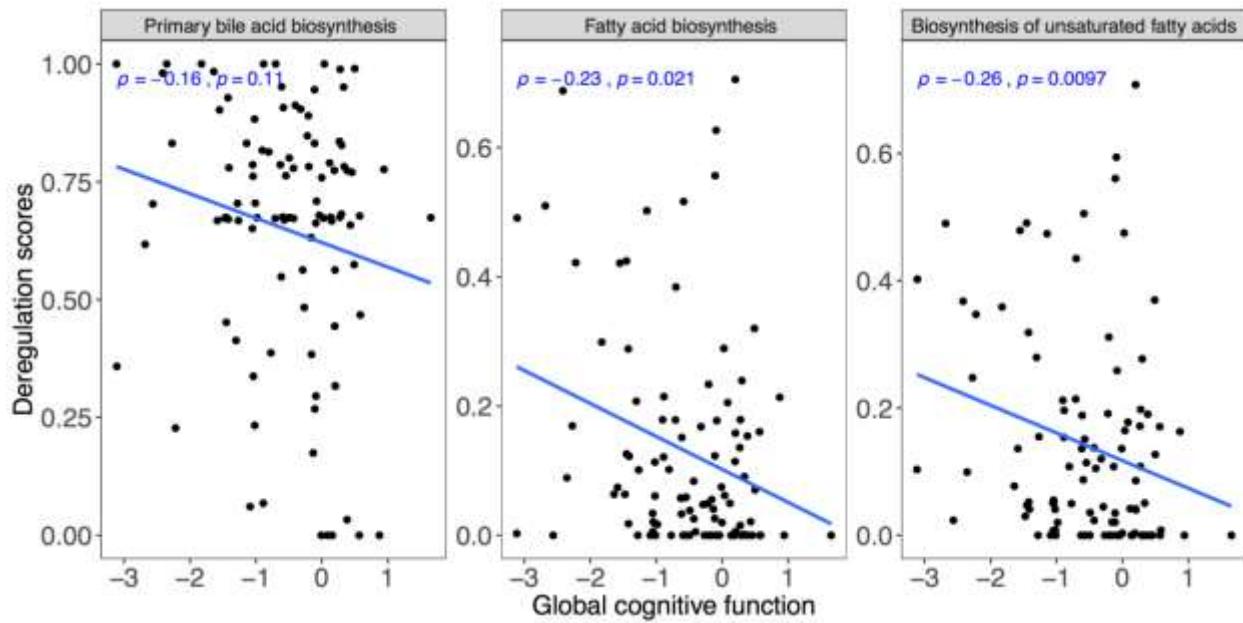

Figure S4. Correlations between PDS of metabolic pathways and global cognitive function in brain.

Scatterplots with ρ s and P -values showing correlations between brain pathway PDS and global cognitive function. ρ , correlation coefficient of Spearman's rank correlation test.

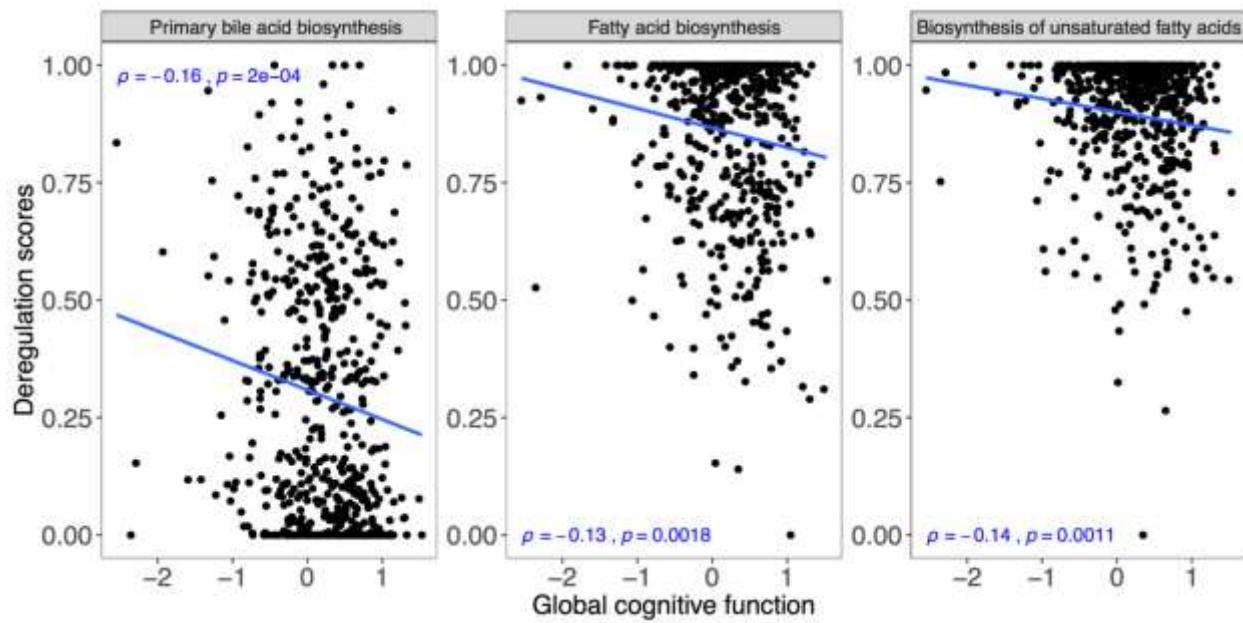

Figure S5. Correlations between PDS of metabolic pathways and global cognitive function in sera.

Scatterplots with ρ s and P -values showing correlations between serum pathway PDS and global cognitive function. ρ , correlation coefficient of Spearman's rank correlation test.

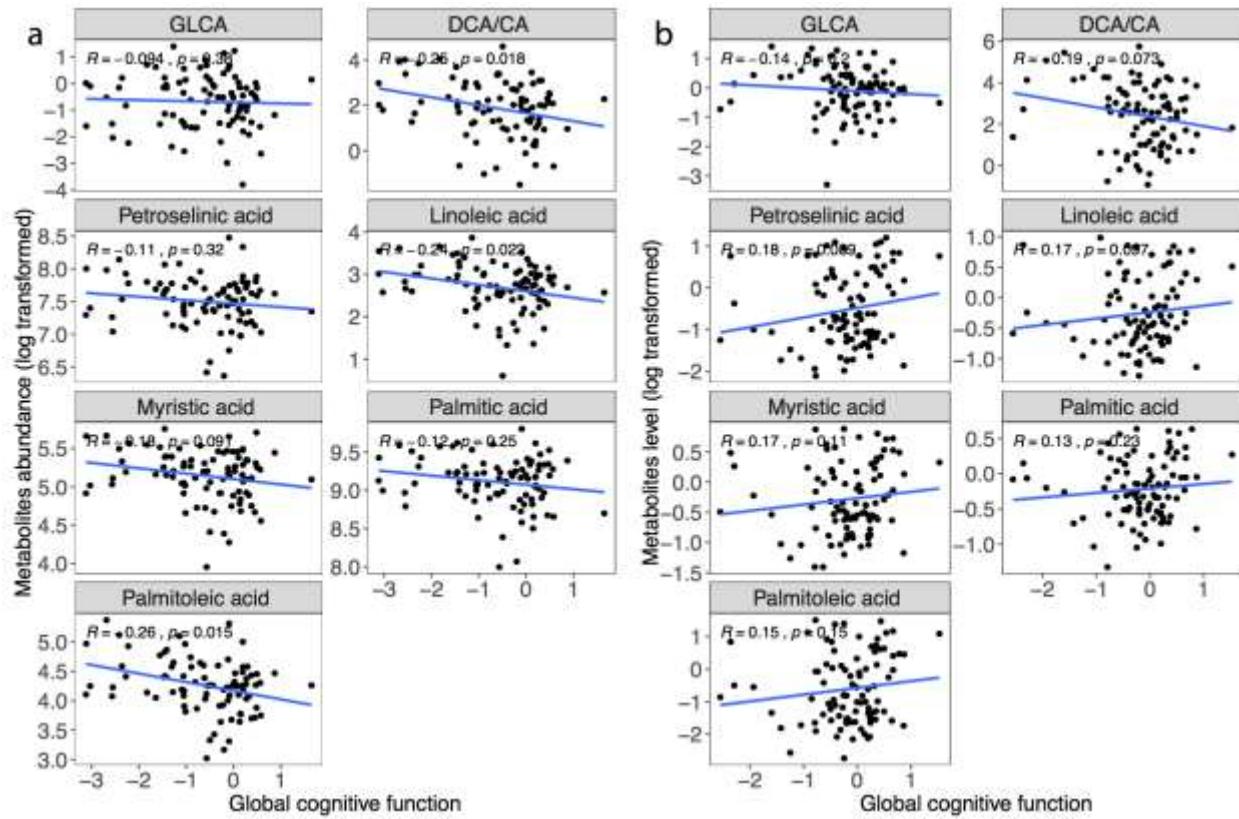

Figure S6. Associations between metabolites level and global cognitive function among participants with both brain and serum samples.

(a) Scatterplots with ρ s and p -values showing associations between brain metabolites abundances and global cognitive function. (b) Scatterplots with ρ s and p -values showing associations between serum metabolites abundances and global cognitive function. ρ , correlation coefficient of Spearman's rank correlation test.

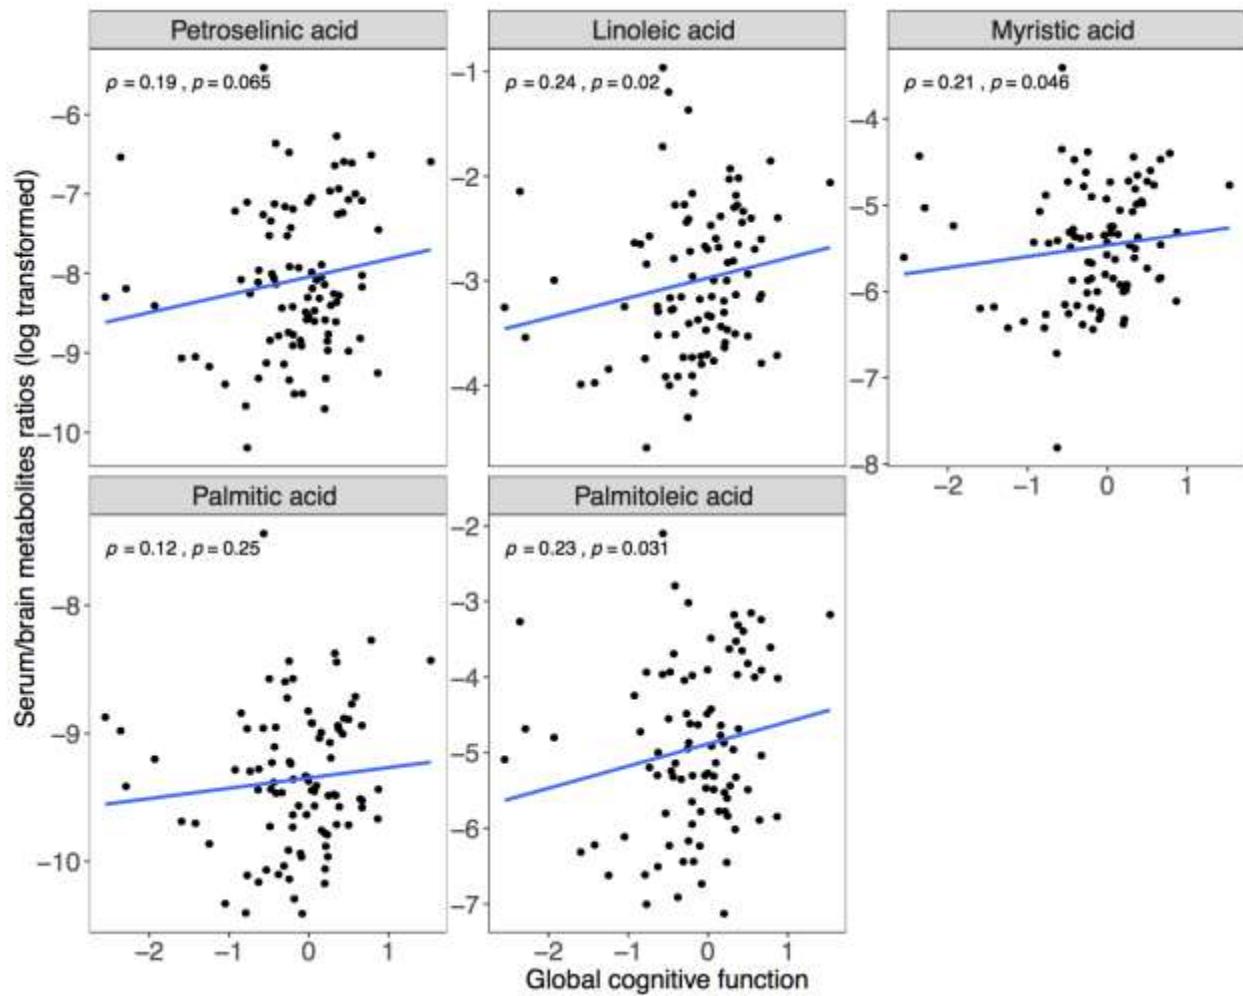

Figure S7. Associations between level of serum/brain FFAs ratios and global cognitive function among participants with both brain and serum samples.

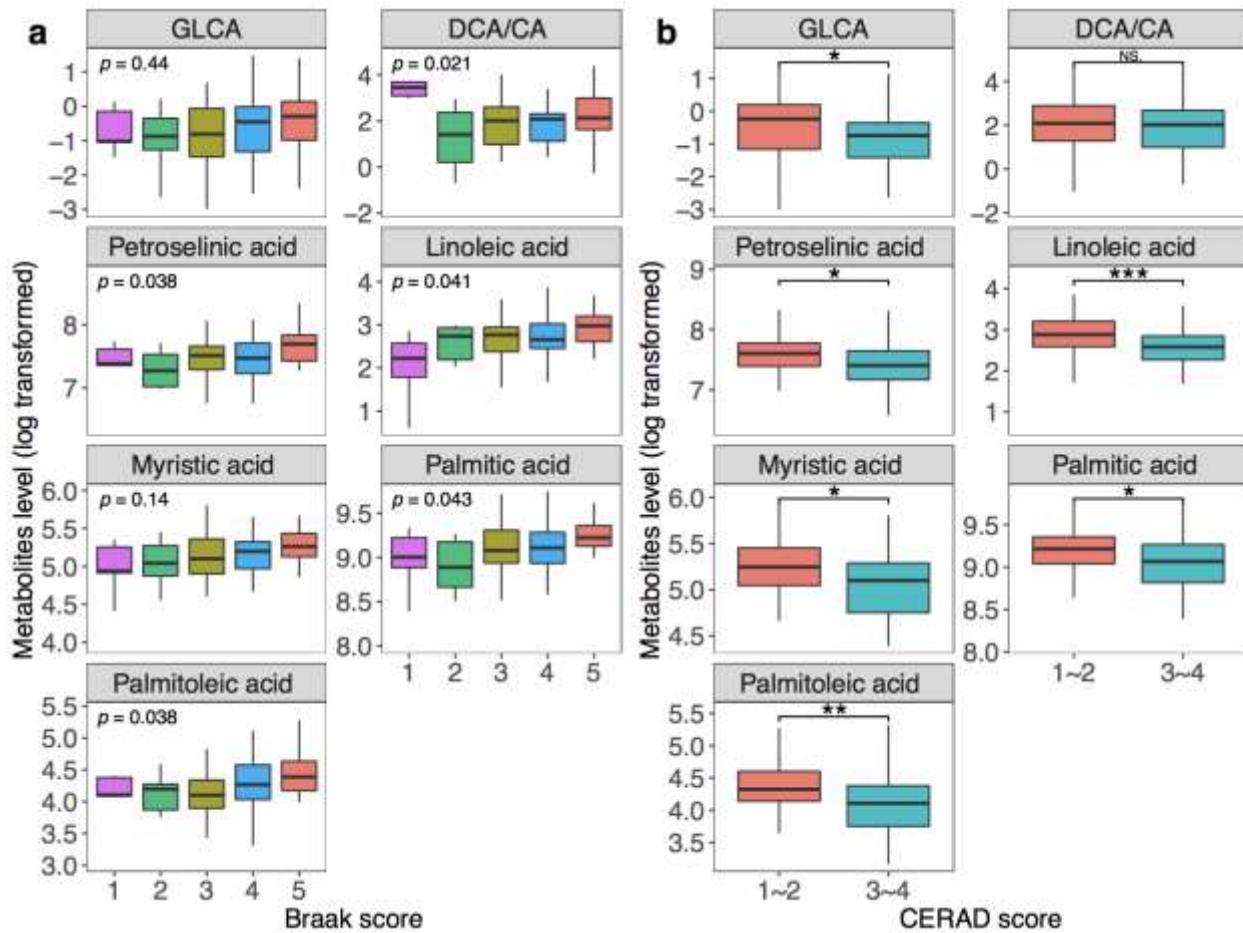

Figure S8. Associations between metabolites level and Braak scores, CERAD scores.

(a) Boxplots showing group differences and P values for identified metabolites across Braak groups for brain tissue abundances. (b) Boxplots showing group differences and significances for identified metabolites across CERAD groups for brain tissue abundances.

* P -value < 0.05 , ** P -value < 0.01 , *** P -value < 0.001 , Wilcoxon rank sum test.

CERAD, Consortium to Establish a Registry for Alzheimer's Disease; NS, not significant.

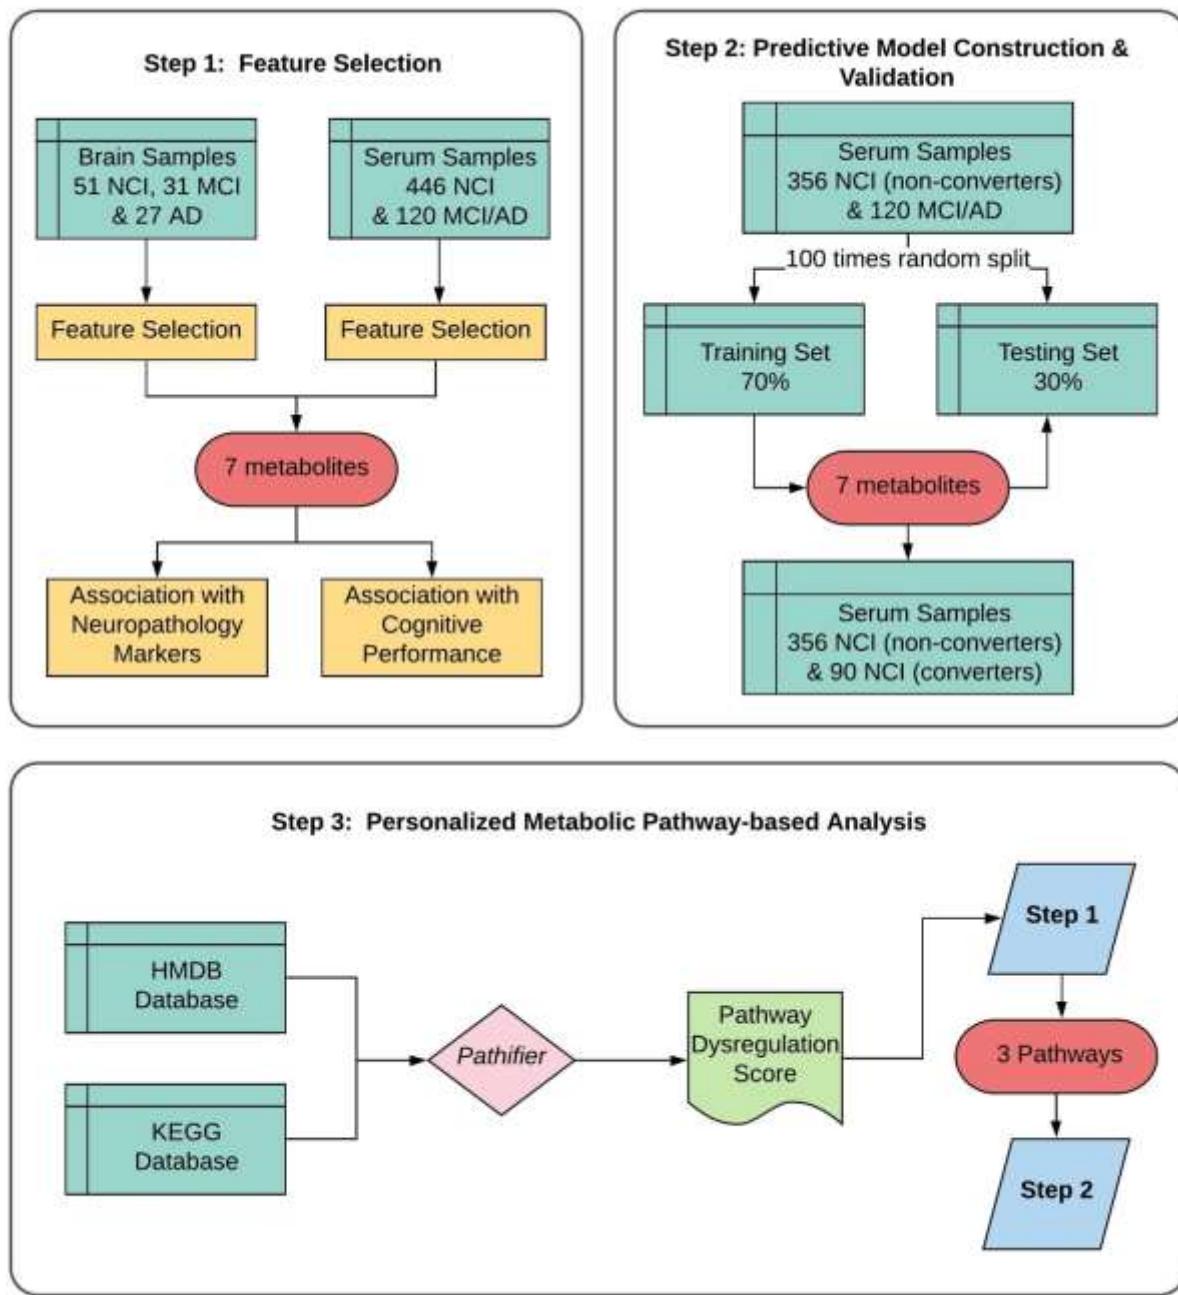

Figure S9. The workflow chart of the data and the analysis.

Supplementary Text

Serum sample preparation

We mixed an aliquot of 50 µL serum with 150 µL methanol, and vortexed the mixture for 2 min, let it stand for 10 min and centrifuged at 4 °C for 10 min. We then transferred 160 µL of the supernatant to a clean tube and vacuum dried the remaining aliquot re-dissolved it with a matched amount of acetonitrile (0.1% formic acid) and added water (0.1% formic acid) to a volume of 40 µL. The supernatant after the centrifugation was used for UPLC-TQMS and GC-TOFMS analysis. A mixture of 20 µL from the final supernatant of each sample was prepared for use as pooled quality control (QC) samples.

Brain sample preparation

We weighted 30 mg brain tissue, homogenized it with 75 µL of 50% precooled methanol using a Bullet Blender Tissue Homogenizer (Next Advance, Inc., Averill Park, NY) for 3 min. After centrifugation at 4 °C for 15 min, we transferred the supernatant to a clean tube. We performed the second step extraction by adding precooled methanol and chloroform mixture (3:1) to the residue followed by centrifugation. We combined the supernatant with the previous one and vortexed the mixture for 5 min and performed centrifugation for 15 min. The supernatant was used for UPLC-TQMS and GC-TOFMS analysis. A mixture of 20 µL from the final supernatant of each sample was prepared for use as pooled QC samples.

Quality control Procedure

Previously prepared QC samples were run between every ten sample injections. For each metabolite in QC samples, we calculated the relative standard deviations (RSDs), which was less than 15% for batches of samples.

Individual bile acid was adjusted by the total bile acids concentration (i.e., % of total bile acids).

All abundance values were log10 transformed.

Table S9. PDS of mapped metabolic pathways across clinical groups in brain samples.

Metabolic Pathways	NCI Mean (SD)	MCI/AD Mean (SD)
Carbon fixation in photosynthetic organisms	0.26 (0.29)	0.29 (0.29)
Purine metabolism	0.27 (0.27)	0.41 (0.32)

Histidine metabolism	0.63 (0.13)	0.63 (0.11)
Pentose and glucuronate interconversions	0.26 (0.14)	0.28 (0.15)
Starch and sucrose metabolism	0.15 (0.18)	0.20 (0.20)
Galactose metabolism	0.36 (0.12)	0.39 (0.13)
Amino sugar and nucleotide sugar metabolism	0.35 (0.20)	0.36 (0.20)
Glycerolipid metabolism	0.84 (0.21)	0.86 (0.20)
Primary bile acid biosynthesis	0.28 (0.27)	0.36 (0.28)

Tropane piperidine and pyridine alkaloid biosynthesis	0.53 (0.15)	0.54 (0.13)
Phenylalanine tyrosine and tryptophan biosynthesis	0.89 (0.17)	0.90 (0.13)
Glucosinolate biosynthesis	0.88 (0.18)	0.90 (0.11)
Fructose and mannose metabolism	0.41 (0.07)	0.41 (0.10)
Biosynthesis of unsaturated fatty acids	0.89 (0.14)	0.93 (0.11)

Abbreviations: NCI, cognitively normal; MCI, mild cognitive impairment; AD, Alzheimer's disease; SD, standard deviation;

Table S11. Levels of identified metabolites in samples with both brain and blood metabolomics data

Brain samples			
	NCI	MCI	AD
GLCA % (median [IQR])	0.44 [0.24, 0.85]	0.50 [0.23, 0.95]	0.88 [0.54, 1.26]*
DCA/CA (median [IQR])	4.98 [1.90, 9.87]	9.14 [5.46, 16.29]	8.08 [3.49, 29.53]*
Petroselinic acid (median [IQR])	1773.24 [1336.51, 2180.72]	1805.46 [1495.15, 2366.08]	2183.78 [1768.03, 2804.06]**
Linoleic acid (median [IQR])	14.93 [11.39, 18.22]	13.60 [9.84, 20.35]	20.36 [16.88, 32.13]***
Myristic acid (median [IQR])	168.36 [133.77, 210.46]	173.05 [136.37, 201.52]	209.63 [178.55, 250.68]**
Palmitic acid (median [IQR])	9447.81 [7175.45, 10634.46]	8762.88 [7642.75, 10873.54]	10651.09 [9135.51, 12702.42]**
Palmitoleic acid (median [IQR])	65.58 [49.05, 78.58]	75.00 [59.59, 97.51]	89.73 [65.83, 132.13]**
Serum samples			
	NCI	MCI/AD	
GLCA % (median [IQR])	0.95 [0.57, 1.41]	1.14 [0.61, 1.61]	
DCA/CA (median [IQR])	12.97 [2.88, 27.57]	19.24 [5.64, 51.86]	
Petroselinic acid (median [IQR])	0.52 [0.32, 1.53]	0.37 [0.25, 0.85]	
Linoleic acid (median [IQR])	0.72 [0.52, 1.37]	0.65 [0.48, 1.00]	
Myristic acid (median [IQR])	0.72 [0.54, 1.36]	0.59 [0.40, 1.00]#	
Palmitic acid (median [IQR])	0.81 [0.59, 1.26]	0.74 [0.56, 0.96]	
Palmitoleic acid (median [IQR])	0.50 [0.22, 1.58]	0.38 [0.19, 0.73]	

* P-value < 0.05, ** P-value < 0.01, *** P-value < 0.001, by Wilcoxon rank sum test comparing AD vs. NCI

P-value < 0.05, by Wilcoxon rank sum test comparing MCI/AD vs. NCI

Abbreviations: NCI, cognitively normal; MCI, mild cognitive impairment; AD, Alzheimer's disease; IQR, interquartile range.
