

Supplementary Figure 2: Partial body doses vs whole body doses for samples with $U > 1.96$. The median RPL glass dosimeter reference dose for each sample is indicated by red horizontal lines. The estimated fraction of irradiated cells is shown on the top of the graph. Error bars show the estimated 95% confidence intervals. Partial body doses were obtained using the default settings of Biodose Tools version 2019.10.15-beta (Hernández et al. 2019). The results of Lab17 were provided after the blind doses were distributed to the participants and are not shown in this figure.
