## Supplementary figures

**A**

(I)  19. Juni 1978

(II) 

(III)

Newspaper article (19<sup>th</sup> June 1978): An original find. Beer from the German Empire era.

Beer label:  
This beer is brewed from the very finest hops and malt and excellent brewing water, represented in all Lloyd-steamers, whose annual purchase is over 300,000 bottles. Purity guaranteed. Ernst Barre successor brewery, Lübbecke in Westphalia. Original brewery filling.

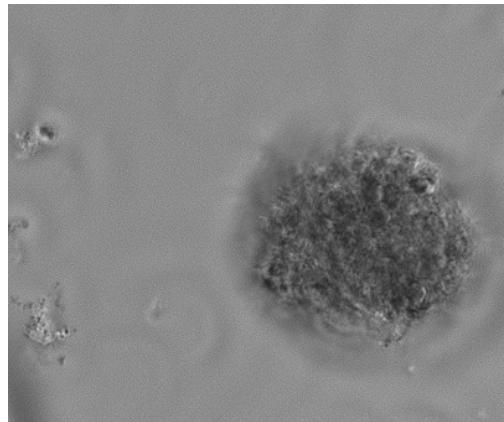

**B**

(I) — Deutsches Bier in Britisch-Indien. Englische Interessenten klagen über die zunehmende Einfuhr deutscher Biere auf Kosten der englischen. In Calcutta stieg die Einfuhr deutscher Biere von 151 870 Gallons im Jahre 1884 auf 198 294 im Jahre 1885, während die englische Bierexport von 286 423 Gallons im Jahre 1884 auf 279,110 Gallons im Jahre 1885 zurückging. (Dass unser Lübbecker Bier hier auch dem englischen die Konkurrenz mit bereitet, ist leicht möglich. Bekanntlich wird von hier viel Exportbier verschickt; auch in New-York z. B. lassen sich die Lübbecker Kinder das heimatliche Barresche Bier vorzüglich munben.)

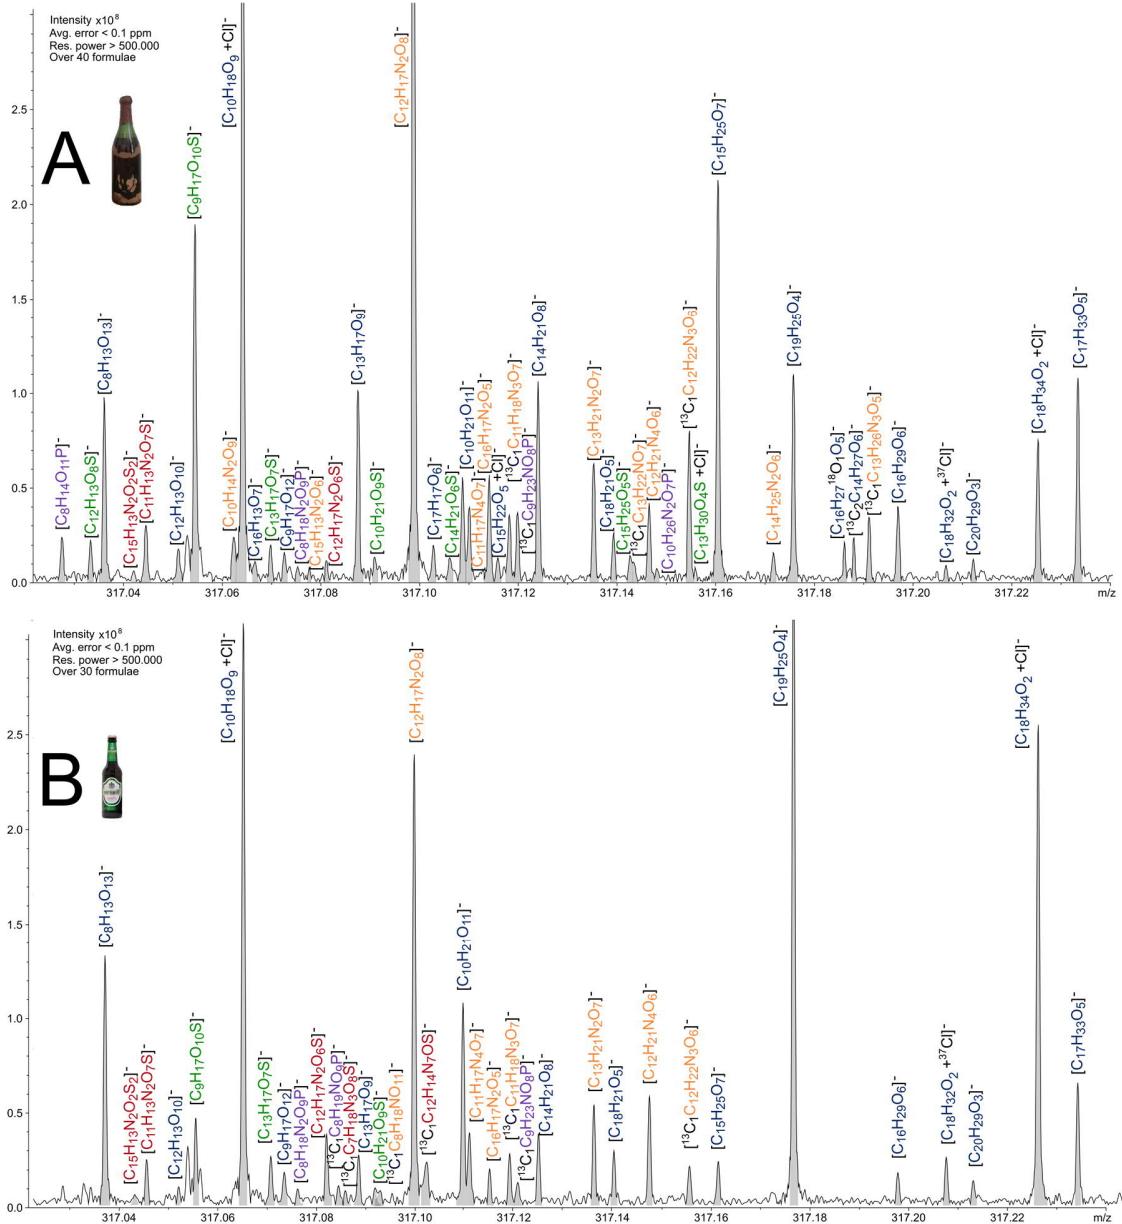

(II)

German beer in British India.  
English interests complain of increasing imports of German beers at the expense of English ones. In Kolkata, imports of German beers increased from 151,870 gallons in 1884 to 198,294 in 1885, while English beer imports decreased from 286,423 gallons in 1884 to 279,110 gallons in 1885. It is quite possible that the Lübbecke beer here is now competing with the English beer. (As is well known, a lot of export beer is shipped from here; even in New York, for example, the children of Lübbecke enjoy the local Barre beer).

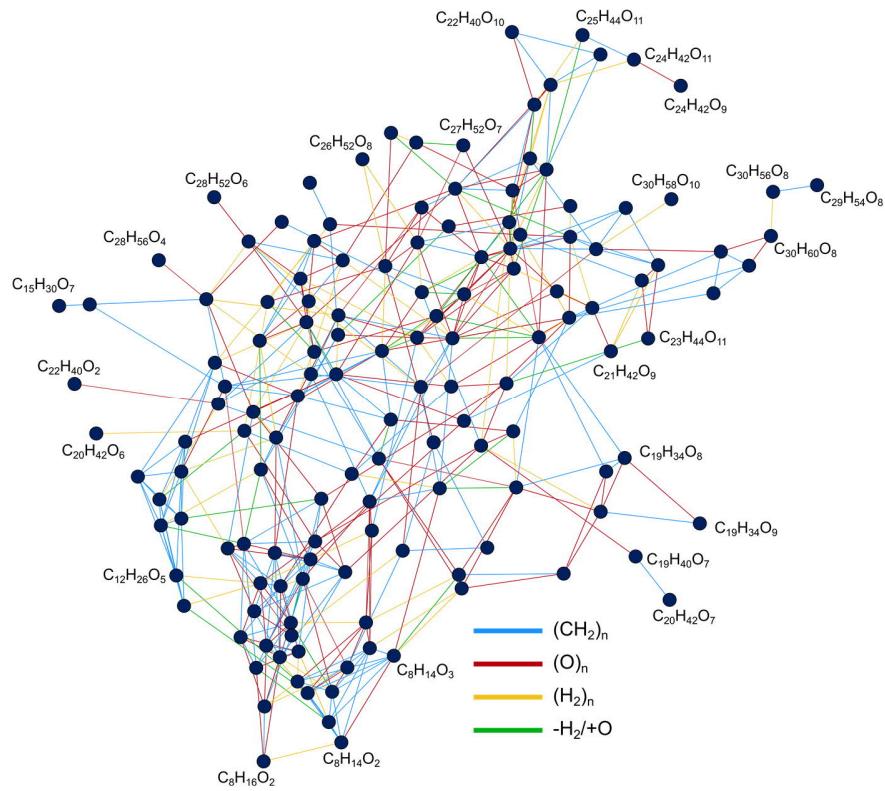

**Supplementary Figure S1. Historical sources about the discovery and origin of the beer.** A Newspaper article of June 1978 (**A-I**) describes the finding of the unique sample from the German Empire era. The historical beer sample and a replica are shown in **A-II**. The German heading of the newspaper article and the beer's label are translated in **A-III**. Another article refers to the export of Barre beers beginning with the year 1885 and the resulting new competition on the world market (**B-I**). It is translated in **B-II**. The pictures of the beer bottles, the newspaper article and the historical article are used under explicit permission of Privatbrauerei Ernst Barre GmbH.

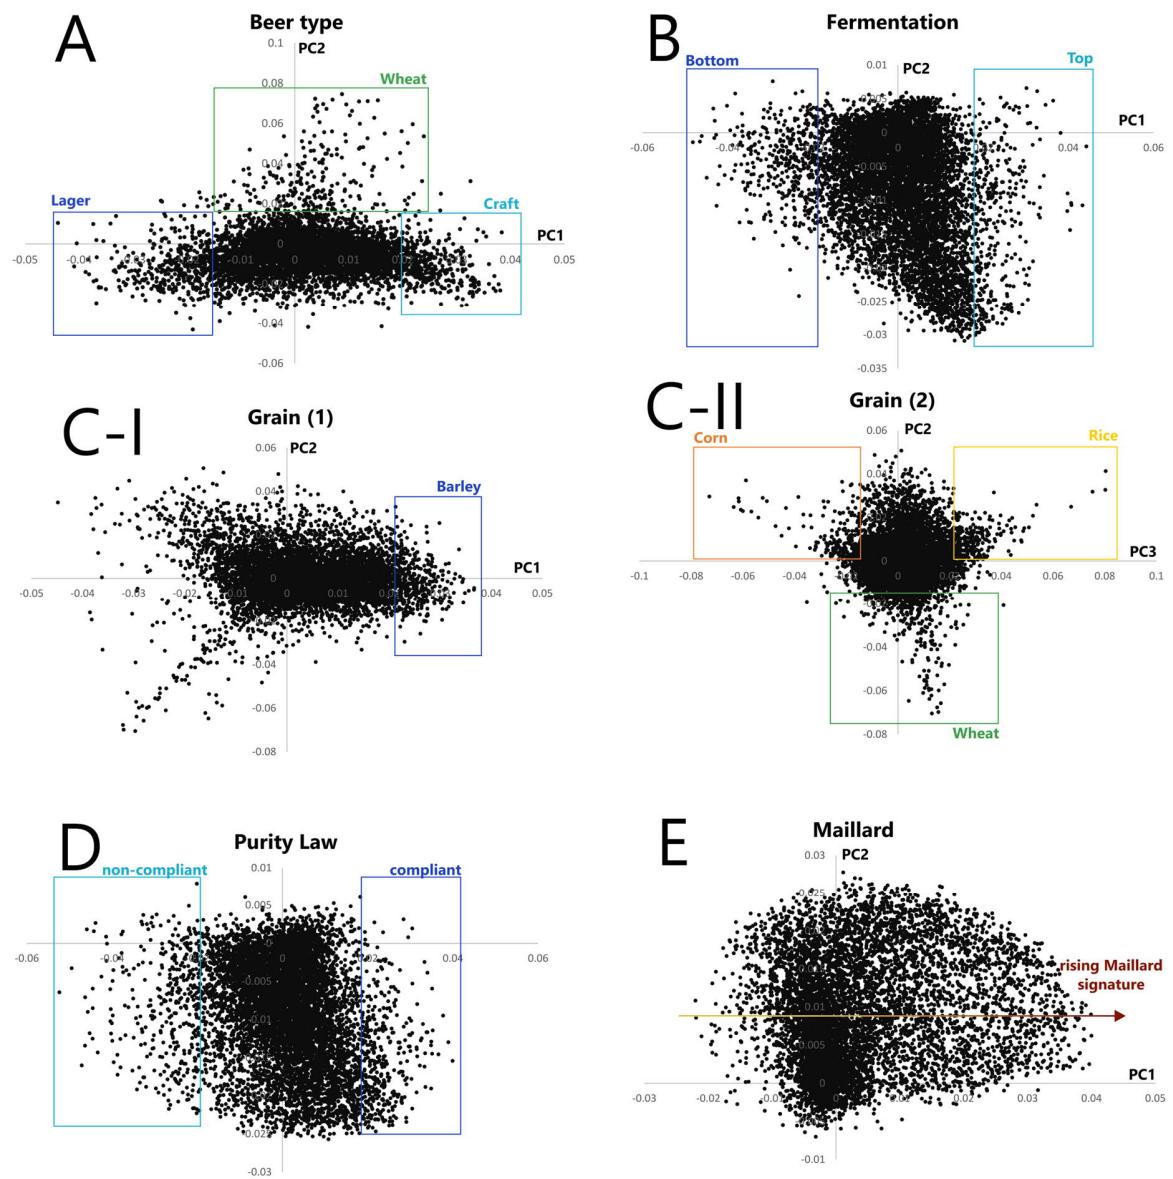

**Supplementary Figure S2. Phase-contrast microscopy of amorphous organic particles of 1885 beer.** Typical particles that occur during the aging of filtered beers due to polyphenol-protein complexation.

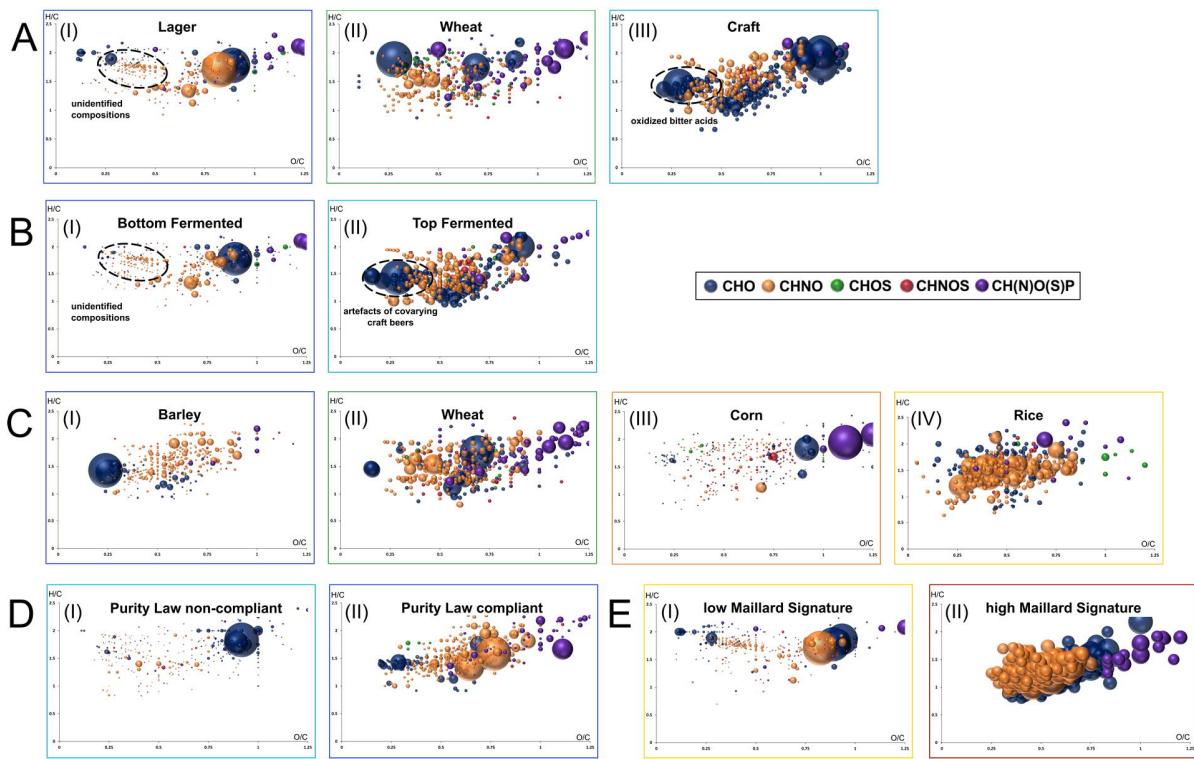

**Supplementary Figure S3. FTICR mass spectrum excerpt of beer B1885 (A) and B2019 (B) showing over 40 different compositions in the nominal mass  $m/z$  317.** Chemical space color code: CHO (blue), CHNO (orange), CHOS (green), CHNOS (red), CH(N)O(S)P (violet). The pictures of the beer bottles are used under explicit permission of Privatbrauerei Ernst Barre GmbH.

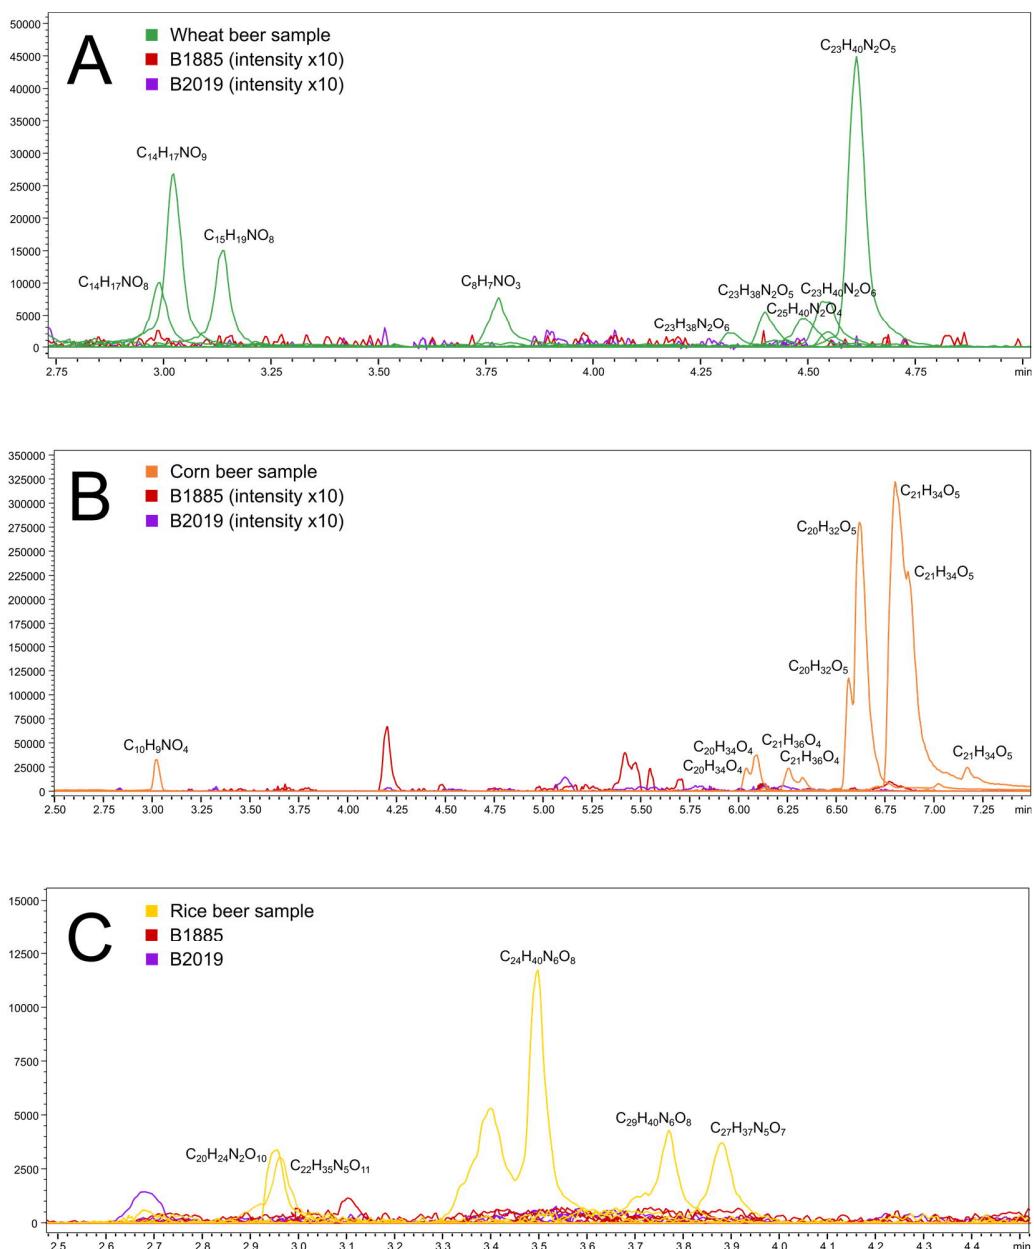

**Supplementary Figure S4.** Mass difference network of specific lipid-type compositions (as specified by their compositional area in the van Krevelen diagram) for the historical beer. The compositions are represented as nodes that are connected by edges, representing changes in the molecular formula equivalent to (bio-)chemical redox processes.

**Supplementary Figure S5. Loading plots including 7,700 compositions for the OPLS-DA differentiating beer types (A), fermentation types (B), grains used (C), compliance with the German purity Law (D) and Maillard signatures by the absorption at 294 nm (E). The features specific for an attribute (unique or significantly more abundant) are highlighted. The 95<sup>th</sup> percentile is highlighted.**

**Supplementary Figure S6. Van Krevelen diagrams of the characteristic compositional profiles for beer types (A), fermentation types (B), grains used (C), compliance with the German Purity Law (D) and Maillard signatures (E). Color code: CHO (blue), CHNO (orange), CHOS (green), CHNOS (red), CH(N)O(S)P (violet). Neutral compositions are depicted. Specific areas are highlighted. Bubble size indicates relative signal intensities.**

**Supplementary Figure S7. Extracted Ion chromatograms of compound masses found to be specific for wheat (A), corn (B) and rice (C) including a respective grain-containing sample, sample B1885 and sample B2019.** The EIC mass range is the respective exact  $m/z$  –value  $\pm$  10 ppm. No overlap of reported marker molecules (Pieczonka et al. (2021), Front. Chem., 9 (715372), 1-12) between the grain-containing samples and samples B1885 and B2019 was observed.
